

UNIVERSITY OF CALICUT

Abstract

General and Academic - Faculty of Science - Syllabus of MSc Computer Science Programme under CCSS PG Regulations 2019 (University Teaching Departments) with effect from 2020 Admission onwards- Incorporating Outcome Based Education - Implemented - Subject to ratification by the Academic Council - Orders Issued.

G & A - IV - J

U.O.No. 5809/2021/Admn

Dated, Calicut University.P.O, 31.05.2021

*Read:-*1. U.O No.10218/2019/Admn, Dated 31.07.2019.

2. Item No.2 in the minutes of the meeting of the Board of Studies in Computer Science & Application PG held on 28.04.2021.
3. Remarks of the Dean, Faculty of Science, Dated 28.05.2021.
4. Orders of the Vice Chancellor in the file of even no, Dated 29.05.2021.

ORDER

1. Orders were issued vide paper read (1) above, implementing the scheme and syllabus of M.Sc Computer Science Programme under CCSS PG Regulations 2019, w.e.f 2019 admission onwards, vide paper read (1) above.
2. The meeting of Board of Studies in Computer Science & Application PG held on 28.04.2021 approved the existing syllabus of M.Sc Computer Science Programme (CCSS),for Teaching Departments /Schools of the University of Calicut, incorporating Outcome Based Education (OBE) , in tune with the new CCSS PG Regulations 2019,with effect from 2020 Admission onwards, vide paper read (2) above.
3. The Scheme and Syllabus of M.Sc Computer Science Programme under CCSS PG Regulations 2019, incorporating Outcome Based Education(OBE) in the existing syllabus, has been approved by the Dean, Faculty of Science, vide paper read (3) above and by the Vice Chancellor, subject to ratification by the Academic Council, vide paper read (4) above.
4. The Scheme and Syllabus of M.Sc Computer Science Programme for Teaching Departments /Schools of the University of Calicut, in tune with the new CCSS PG Regulations 2019, incorporating Outcome Based Education (OBE) in the existing syllabus, is therefore implemented with effect from 2020 Admission onwards.
5. Orders are issued accordingly.
6. U.O No.10218/2019/Admn dated 31.07.2019 stands modified to this extent. (modified syllabus appended)

REGULATIONS

The existing regulations of Choice-based Credit Semester System (UO No. 4500/2019/Admn. Dated 26-03-2019) which are applicable for University Teaching Departments are also applicable for this programme with the following exceptions.

I Objectives: The course of the MSc (Computer Science) Programme is designed with the following objectives:

- To equip students to take up challenging research oriented responsibilities and courses for their higher studies/profession.
- To train and equip the students to meet the requirements of the Software Industry in the country and outside.
- To motivate and support the students to prepare and qualify challenging competitive examinations such as JRF/NET/JAM/GATE etc.

II Programme Structure:

- 1 Duration of the course shall be 2 years, divided into 4 semesters. The entire period of the four semester shall be divided for one core and one elective courses and for the Project Work.
- 2 The programme includes three types of courses, viz., Core courses (Code C), Elective Courses (Code E) and Audit Courses (Code A).
- 3 Selection and Eligibility for Admission is based on the existing University rules.
- 4 Evaluation of all semester theory papers will be on the basis of existing CCSS norms.
- 5 Conduct of Practical Examinations: Odd semester Practical Examinations will be conducted internally by the Department and Even Semester Examinations will be conducted by the Controller of Examination.
- 6 Core Courses: 'Core Course' means a course of a particular degree programme, which must be successfully completed by a student to receive the degree and which cannot be substituted by any other course. Core courses are offered by the Department conducting the programme.
- 7 Elective courses: 'Elective course' means a courses which can be substituted by equivalent course from the same or other Department/Schools and which must be successfully completed to receive the degree.

- 8 Audit Courses: There will be two Audit Courses with 2 credits each
- i. Ability Enhancement Course: A compulsory course which is mandatory for all programmes but its grade will be not be counted for the computation of SGPA or CGPA. This course is to get professional competency and exposure in the coarsened core area.
 - ii. Professional Competency Course: A compulsory course which is mandatory for all programmes but its grade will be not be counted for the computation of SGPA or CGPA. This course is to enhance the ability and skill in the coarsened core area.

These have to be done one each in the first two semesters. The credits will not be counted for evaluating the overall SGPA and CGPA. Concerned Department shall conduct examination for these courses and have to intimate /upload the results of the same to the University on the stipulated date during the III Semester. Students have to obtain only minimum pass requirements in the Audit Courses.

- 9 **Project Work and Viva:** The Project work should be carried out over the period of 16 weeks in the final semester in an Industry / R and D organization / Department/Institution. If the project is carried out in an Industry / R and D organization outside the campus, then a co-guide shall be selected from the Department/ Institution concerned. Every student should do the Project individually and no grouping is allowed. All the candidates are required to get the approval of their synopsis and the guide before commencement of the project from the Department / Institution and the matter may be intimated to the University at the beginning of the semester by the Department / Institution. The project will be reviewed periodically every month by the Department / Institutional. The continuous assessment marks (CA) will be based on the periodic progress and progress report.

At the end of the semester the candidate shall submit the Project report (two bound copies and one soft copy) duly approved by the guide, co-guide for End Semester Assessment. Evaluation for ESA should be conducted by a board of examiners appointed by the University. (Mark Distribution: Content 30% + Methodology 30% + Presentation 20 %, and Via- voce 20 %). If project work and the report are found to be not up to the expected standard, the examiners can ask the candidate to modify and resubmit the project report after incorporating the suggestions of the examiners. Such reports shall be resubmitted within the stipulated period suggested by the examiner(s).

A PROGRAMME OUTCOME (PO)

At the end of post graduate program at Department of Computer Science, University of Calicut, a student would have:

PO1: Attained profound expertise in computing science discipline.

PO2: Acquired ability to function in multidisciplinary domains.

PO3: Equipped with comprehensive knowledge and understanding of advanced theoretical fundamentals in computer science as well as contemporary key research issues in specialized areas.

PO4: Attained ability to exercise research intelligence and innovations.

PO5: Proficiency in ethical principles and committed to professional ethics.

PO6: Incorporated self-directed and life-long learning.

PO7: Obtained ability to maneuver in diverse contexts with global perspective.

B PROGRAMME SPECIFIC OUTCOME (PSO)

PSO1: Evaluate complex real world problems by applying principles of theoretical computing, engineering and mathematical models.

PSO2: Understand concepts and applications in the field of Computer Sciences viz. Computational Intelligence, Machine learning, Web technology, Information Retrieval Systems, Data Analytics, Communication and networking.

PSO3: Identify, analyse, and synthesize scholarly literature relating to the field of computer science to design, analyze and interpret data to find solutions

PSO4: Conceive Project Management capabilities to solve real world problems in accordance with the needs of the industry, in a stipulated time frame.

PSO5: Prepare to address the challenging requirements coming from the enterprise applications.

PSO6: Innovate, experiment and analyze research findings and practice the process of scientific publishing.

COURSE STRUCTURE AND SCHEME OF EVALUATION

Semester 1

Sl.No.	Course Code	Course	Instructional Hrs/week		Exam Duration		Marks			Credit
			Lect/Lab	Tutorial	Theory	Practical	ESA	CA	Total	
1	CSC1C01	Discrete Mathematical Structures	3	1	3	—	80	20	100	4
2	CSC1C02	Advanced Data Structures and Algorithms	3	1	3	—	80	20	100	3
3	CSC1C03	Principles of Programming Methodology	3	1	3	—	80	20	100	4
4	CSC1C04	Theory of Computation	3	1	3	—	80	20	100	4
5	CSC1C05	Computer Organization and Architecture	3	1	3	—	80	20	100	4
6	CSC1C06	Practical 1	10	5	—	3	80	20	100	3
7	CSC1A01	Introduction to Research Methodology	—	—	3	—	—	100	100	2
Total			25	10	—	—	—	—	600	22

Semester 2

Sl.No.	Course Code	Course	Instructional Hrs/week		Exam Duration		Marks			Credit
			Lect/Lab	Tutorial	Theory	Practical	ESA	CA	Total	
1	CSC2C07	Design and Analysis of Algorithms	3	1	3	—	80	20	100	4
2	CSC2C08	Advanced Database Management System	3	1	3	—	80	20	100	4
3	CSC2C09	Operating System Concepts	3	1	3	—	80	20	100	4
4	CSC2C10	Object Oriented Programming with Java	3	1	3	—	80	20	100	3
5	CSC2E01-07	Elective 1	3	1	3	—	80	20	100	4
6	CSC2C11	Practical 2	10	5	—	3	80	20	100	3
7	CSC2A02	Term Paper	—	—	—	—	—	100	100	2
	Total		25	10	—	—	—	—	600	22

Elective 1	Credit
CSC2E01- Artificial Intelligence	4
CSC2E02 - Information Theory and Coding	4
CSC2E03 - Computer Graphics	4
CSC2E04 - Advanced Microprocessor and Micro Controller	4
CSC2E05 - Numerical and Statistical Methods	4
CSC2E06 – Distributed Computing	4
CSC2E07 – Simulation and Modelling	4

Semester 3

Sl.No.	Course Code	Course	Instructional Hrs/week		Exam Duration		Marks			Credit
			Lect/Lab	Tutorial	Theory	Practical	ESA	CA	Total	
1	CSC3C12	Principles of Compiler Design	3	1	3	—	80	20	100	4
2	CSC3C13	Data Communication and Networking	3	1	3	—	80	20	100	4
3	CSC3C14	Web Technology	3	1	3	—	80	20	100	3
4	CSC3E08-CSC3E18	Elective 2	3	1	3	—	80	20	100	4
5	CSC3E08-CSC3E18	Elective 3	3	1	3	—	80	20	100	4
6	CSC3C15	Practical 3	10	5	—	3	80	20	100	3
	Total		25	10	—	—	—	—	600	22

Elective 2		Credit
CSC3E08 - Digital Image Processing		4
CSC3E09 - Wireless and Sensor Networks		4
CSC3E10 - Cryptography and Network Security		4
CSC3E11 - Remote Sensing and GIS		4
CSC3E12 - Digital Image Forensics		4
Elective 3		Credit
CSC3E13 - Soft Computing Techniques		4
CSC3E14 - Data Warehousing and Data Mining		4
CSC3E15 - Information Retrieval Systems		4
CSC3E16 - Data Analytics Using Python		4
CSC3E17 - Advanced Machine Learning		4
CSC3E18 - Advanced Java Programming		4

Semester 4

Sl.No.	Course Code	Course	Instructional Hrs/week		Exam Duration		Marks			Credit
			Lect/Lab	Tutorial	Theory	Practical	ESA	CA	Total	
1	CS4C16	Software Engineering	3	1	3	—	80	20	100	4
2	CS4E19-27	Elective 4	3	1	3	—	80	20	100	4
			Duration of the Project				Viva voce	CA	Total	
3	CS3C17	Project Work & dissertation	16 Weeks	—	—	400	300	100		8
	Total		6	2	—	—	—	—	600	16

Elective 4	Credit
CSC4E19 - Pattern Recognition	4
CSC4E20 - Natural Language Processing	4
CSC4E21 - Bio Informatics	4
CSC4E22 - Mobile Communication	4
CSC4E23 - Semantic Web Technology	4
CSC4E24 - Virtualization and Cloud Computing	4
CSC4E25 - Storage Area Network	4
CSC4E26 - Software Development for Portable Devices	4
CSC4E27 - Fundamentals of Big Data	4

UNIVERSITY OF CALICUT

Department of Computer Science

**M.Sc. Computer Science
Under CCSS (Effective from 2020 Admission Onwards)**

DETAILED SYLLABUS

©University of Calicut.

First Semester

CSC1C01: Discrete Mathematical Structures

Course Number: 1

Contact Hours per Week: 4 (3 Lecture + 1 Tutorial)

Number of Credits: 4

Course Outcomes:

CO1: Verify the validity of an argument using propositional and predicate logic

CO2: Understand the basic concepts of set theory and apply operations on set

CO3: Apply operations of relations and functions in discrete structures

CO4: Identify Group, Ring and Field in Group Theory

CO5: Understand applications of Graph Theory and Tree

CO6: Employ the concepts of graph theory and trees to formulate problem solving

Unit I :

Propositional Logic: Statement Formulas and Truth Tables, Well Formed Formulas-Tautologies-Equivalence of Formulas-Duality Law-Tautological Implications-Normal Forms, Theory of Inference for the Statement Calculus. Predicate Calculus, Quantifiers, Free and Bound Variables, Inference Theory of the Predicate Calculus.

Unit II :

Set Theory-Sets and subsets-Set operations and their properties-Cartesian Products, Relations-Relation matrices- Properties of relations-Composition of relations, Equivalence relations and partitions-Partial Ordering.

Unit III :

Functions and Relations: Functions-Types of Functions, Composition of Functions and Inverse Functions. Relations -Relations and Their Properties, Functions as relations, Closure of Relations, Composition of relations, Equivalence Relations and Partitions. Partial Ordering, Hasse Diagram. The Pigeon hole Principle.

Unit IV :

Group Theory-Definition and Elementary Properties-Cyclic Groups- Homomorphism and Isomorphism-Subgroups-Cosets and Lagrange's Theorem, Rings and Fields-Definitions and examples of Rings, Integral Domains and Fields

Unit V :

Graph Theory-Paths and Cycles, Graph Isomorphism, Bipartite Graphs, Subgraphs, Representation of Graphs, Eulerian and Hamiltonian Properties of Paths-Trees-Spanning Trees, Cayley's theorem, Kruskal's Algorithm, Prim's Algorithm. Dijkstra's Algorithm to Find Shortest Path in Weighted Graphs.

CSC1C02: Advanced Data Structures and Algorithms

Course Number: 2

Contact Hours per Week: 4 (3 Lecture + 1 Tutorial)

Number of Credits: 3

Course Outcomes:

CO1: Understand different categories of data structures

CO2: Design algorithms to perform operations with linear and non – linear data structures.

CO3: Describe how arrays, linked lists, stacks, queues, trees and graphs are represented in memory and used by algorithms.

CO4: Illustrate the basic concepts and implementation details of selected linear and nonlinear data structures.

CO5: Demonstrate different methods for traversing trees.

CO6: Understand the hashing algorithms and their implementations.

CO7: Describe Analyse algorithm control structures and solving

CO8: Discuss the computational efficiency of the principal algorithms for sorting, searching and hashing.

CO9: Describes various types of trees and heap structures.

Unit I :

Overview of Data Structures, Data Abstraction & Abstract data types. Arrays-Records-Representation. Data Structure operations: Traversing, Inserting and deleting, sorting and searching. Linear Search & Binary Search- Complexity.

Unit II :

Linear Data structures: Stack-operations and its implementations-Parsing arithmetic expressions, translating and evaluating; Recursion- characteristics of recursion-comparison of recursive and non-recursive algorithms, Queue- operations and its implementations-Circular queue-dequeue - priority queues, Linked Lists- Operations and implementations-Doubly Linked Lists and Circular lists-Sparse matrix representation.

Unit III :

Non-linear Data Structures: Trees-Tree traversals algorithms- Binary Tress-Threaded Binary Trees-Binary search Trees-Traversals and operations on BST - balanced trees-AVL, Red-Black Trees, Splay Tree, B-Tree, M-way Trees-Operations and their implementation.

Unit IV :

Hashing: Overview of hashing-Hash tables- hash functions and their computations-open addressing-Linear probing- quadratic probing-double hashing algorithms and their implementations-Separate chaining-Hashing efficiency.

Unit V :

Heap: Overview of heaps-Implementation and operations. Sorting techniques: Insertion sort- Selection sort- Shell sort- Bubble sort- Quick sort-Heap sort- Merge sort- External sort- Comparison of sorting algorithms. Graphs- representation of graphs-operations- traversals and their implementation- minimum spanning trees-shortest path problem-Efficiency of various graph algorithms.

CSC1C03: Principles of Programming Methodology

Course Number: 3

Contact Hours per Week: 4 (3 Lecture + 1 Tutorial)

Number of Credits: 3

Course Outcomes:

CO1: Illustrate various notions of flowchart and algorithms.

CO2: Design flowchart and algorithm for a given problem.

CO3: Understand Documentation and Program Maintenance.

CO4: Determine the data representation formats for a specific problem domain.

CO5: Demonstrate C Language preliminaries, Operators and expressions

CO6: Examine the merits and demerits of various programming constructs viz pointers structures and union

CO7: Implement the basic operations in file handling

CO8: Design, develop, implement, test and document well-structured and reliable computer programs using the C programming language.

Unit I :

Problem Solving-Flow Chart for Structured Programming-Program Charts-System Charts-Variables, data names, programming statements-Flow Chart Symbols-Terminal Symbols-I/O-Comments- Connectors-Process-Decision. Algorithm Design-Problem Solving Aspect- Top Down Design-Formal Conventions- Writing Algorithms- Fundamental Algorithms with flow chart. Program- Characteristics of a good program- Modular Approach- Programming style- Documentation and Program Maintenance- Compilers and Interpreters- Running and Debugging Programs- Syntax Errors-Run- Time Errors- Logical Errors- Concept of Structured Programming.

Unit II :

C Language preliminaries-C character set, Identifiers and keywords, Data types, Declarations, Expressions, statements and symbolic constants.

Input-Output-getchar, putchar, scanf, printf, gets, puts, functions. Pre-processor directives. Operators and expressions-Arithmetic, unary, logical, bit-wise, assignment and conditional operators. Control statements-While, do-while, for statements, nested loops, if else, switch, break, Continue, and goto statements, comma operators. Storage types-Automatic, external, register and static variables.

Unit III :

Functions-Defining and accessing, passing arguments, Function prototypes, Recursion, Library functions, Static functions. Arrays-Defining and processing, Passing arrays to a function, Multi-dimensional arrays. Strings-Defining and operations on strings.

Unit IV :

Pointers-Declarations, Passing pointers to a function, Operations on pointers, Pointer Arithmetic, Pointers and arrays, Arrays of pointers function pointers. Structures-Defining and processing, Passing to a function, Unions, typedef, array of structure, and pointer to structure.

Unit V :

File structures-Definitions, concept of record, file operations: Storing, creating, retrieving, updating Sequential, relative, indexed and random access mode, Files with binary mode(Low level), performance of Sequential Files, Direct mapping techniques: Absolute, relative and indexed sequential files (ISAM) concept of index, levels of index, overflow handling. File Handling-File operation-creation, copy, delete, update- Text file, binary file.

CSC1C04: Theory of Computation

Course Number: 4

Contact Hours per Week: 4 (3 Lecture + 1 Tutorial)

Number of Credits: 4

Course Outcomes:

CO1: Understand basic concepts in the theoretical foundations of computer science.

CO2: Interpret types of formal languages and its machine equivalence

CO3: Construct automata and grammar for all formal languages

CO4: Model the concept of Turing Machines and Develop mathematical views towards general computation.

CO5: Understand machines hierarchy with respect to the capabilities using the Chomsky hierarchy.

CO6: Classify NP and P problems

Unit I :

Preliminaries: Review of proof techniques-Mathematical induction - Basic concepts of languages automata and grammar-Alphabet, languages and grammars, productions and derivation. Regular languages: Regular expressions- Finite deterministic and non-deterministic automata-regular grammar. Equivalence between various models. Closure properties regular languages-DFA state minimization-Pumping lemma and proof for existence of non regular languages.

Unit II :

Context-Free Grammars (CFG)- Derivations- sentential forms- Parse tree- Ambiguity in grammars and Languages- Applications of CFG- Simplification of Context free Grammars- Normal forms: Chomsky Normal form (CNF) and Greibach Normal form (GNF).

Unit III :

Pushdown Automata (PDA)- Formal definition-Graphical notations - Language accepted by PDA- Deterministic and Non Deterministic PDA - Equivalence of PDAs and CFGs-Pumping lemma for CFLs, Closure properties of CFLs - Decision properties of CFL. Context-sensitive languages: Context-sensitive grammars (CSG) and languages, linear bounded automata and equivalence with CSG.

Unit IV :

Turing Machines- Notation- Instantaneous Description- Transition Diagram- The language of a Turing Machine- Variants of TMs- Multitape TMs, Nondeterministic TMs- TMs with semi - infinite tapes, multistack machines - Universal Turing Machines- Equivalence of the various variants with the basic model - Church-Turing Thesis.

Unit V :

Computability- Closure properties of recursive and recursively enumerable language. Context Sensitive Language and LBA- Equivalence of LBA and CSG- The Chomsky Hierarchy Un-decidability - Halting problem- reductions- Complexity: Complexity Classes - Class P - Class NP- NP complete and NP Hard problems.

CSC1C05: Computer Organization and Architecture

Course Number: 5

Contact Hours per Week: 4 (3 Lecture + 1 Tutorial)

Number of Credits: 4

Course Outcomes:

CO1: Model number system concepts.

CO2: Design sequential circuit and combinational circuit.

CO3: Demonstrate the functional architecture of a computer system.

CO4: Illustrate principles of the memory system.

CO5: Understand 8085 and 8086 microprocessor architecture.

Unit I :

Digital Computers and Digital Systems, Number systems and Conversions, Digital Logic Circuits- Boolean Algebra & Map simplification, combinational circuits, flip flops, design of sequential circuits, Digital Components-Integrated Circuits, Decoders, Multiplexers, Registers, Shift Registers, Binary Counters, data representation - data types, complements, fixed-point representation, floating-point representation, other binary codes, error detection codes.

Unit II :

Computer Arithmetic: addition of positive numbers, design of fast adders, signed addition and subtraction, Arithmetic and Branching Conditions, Multiplication of positive numbers, signed number multiplication- Booth Algorithm, fast multiplication, division- restoring and non-restoring algorithms, floating point numbers and operations- single & double precision.

Unit III :

Basic computer organization-machine instructions- classification, function, addresses, size, addressing modes- instruction cycle - instruction sequencing. fundamental concepts- registers, register transfers, performing arithmetic or logic operations, memory read and write, execution of a complete instruction, branch instruction, Single bus, two bus, three bus organization, a complete processor- Control unit: - hardwired control, microprogrammed control, micro instructions-types.

Unit IV :

The Memory System: Some Basic Concepts, Semiconductor RAM Memories, Read-Only Memories, Speed, Size and Cost, Cache Memories, Virtual Memories, Memory Management Requirements, Secondary Storage, memory interleaving. Input / Output Organization -Accessing I/O devices- programmed I/O, interrupt I/O - interrupts - interrupt processing- hardware interrupts-programmable interrupt controller-vectored interrupts - interrupt nesting - daisy chaining- direct memory access (DMA)- DMA operations & DMA Controller, Introduction to I/O interfaces, I/O channels, IO Processors.

Unit V :

8085 microprocessor - Architecture: Block diagram-addressing modes-instruction set, Instruction cycle-timing diagrams - different machine cycles - fetch and execute operations - estimation of execution time. 8086 microprocessor - Architecture: Block diagram-Intel 8051 Micro controller-Architecture - basic instructions-basic assembly language programs-peripherals: interrupts, timers, parallel port, serial port.

CSC1C06: Lab I - C Programming

Course Number: 6

Number of Credits: 3

Number of Contact Hours: 5 (10 Practical + 5 Tutorial)

Course Outcomes:

Develop programs relating to the theory portions covered in CS1CC03 Principles of Programming Methodology and CS1CC02 Advanced Data Structures and Algorithms

CO1: Develop programming skills using the fundamentals and basics of C language.

CO2: Develop programs using the basic elements like control statements, arrays and strings.

CO3: Design and implement the effective usage of arrays, structures, functions and pointers.

CO4: Implement files handling and command line arguments.

CO5: Demonstrate the concepts of stack, queue and linked list and apply various operations on them.

CO6: Demonstrate the concept of tree traversal and its operations.

CO7: Design program based on the concepts of sorting and searching techniques.

Unit I C Programming:

Develop programs to implement the following:

1. HCF (Euclid's algorithm) and LCM of given numbers.
2. Find mean, median and mode of a given set of numbers
3. Conversion of numbers from binary to decimal, hexadecimal, octal and back.
4. Evaluation of functions like e^x , $\sin x$, $\cos x$ etc. for a given numerical precision using Taylor's series.
5. Testing whether a given number is prime.
6. String manipulation programs: sub-string search, deletion.
7. Lexicographic sorting of a given set of strings.

8. Generation of all permutations of the letters of a given string using recursion.
9. Programs to find the product of two matrices.
10. Inverse and determinant (using recursion) of a given matrix.

Unit II Data Structures and Algorithms:

Implement the following:

1. Singly linked list with operations to access data, add node and delete node.
2. Variations on linked lists.
3. Sparse matrix.
4. PUSH, POP operations of stack using Arrays/using linked lists.
5. Add, delete operations of a queue using Arrays.
6. Add, delete operations of a queue using linked lists.
7. Variations on queues.
8. Conversion of infix to postfix using stack operations.
9. Postfix Expression Evaluation using stack.
10. Towers of Hanoi Problem
11. Addition of two polynomials using linked list.
12. Binary tree using linked lists
13. Binary tree traversals.
14. Variations on tree structures
15. Graphs/Graph traversals
16. Shortest path algorithm
17. Sorting techniques/Search algorithms.

CSC1A01: Introduction to Research Methodology

Course Number: 7

Number of Credits: 2

Course Outcomes:

CO1: Understand foundations of research, characteristics of scientific methods.

CO2: Describe problem identification and formulation process.

CO3: Apply the ethical principles of research.

CO4: Identify the components of a literature review process.

CO5: Model basic knowledge in research design, data analysis and interpretation

CO6: Familiarize the tools and techniques for Research

CO7: Critically analyze published research works.

CO8: Innovate and apply research methods in the discipline of computing.

Unit I :

Foundations of Research: Meaning, Objectives, Motivation, Utility. Concept of theory, empiricism, deductive and inductive theory. Characteristics of scientific method - Understanding the language of research - Concept, Construct, Definition, Variable. Research Process.

Unit II :

Problem Identification & Formulation - Research Question - Investigation Question - Measurement Issues - Hypothesis - Qualities of a good Hypothesis - Null Hypothesis & Alternative Hypothesis. Hypothesis Testing - Logic & Importance.

Unit III :

Research Design: Concept and Importance in Research - Features of a good research design - Exploratory Research Design - concept, types and uses, Descriptive Research Designs - concept, types and uses. Experimental Design: Concept of Independent & Dependent variables.

Unit IV :

Data Analysis: Data Preparation - Univariate analysis (frequency tables, bar charts, pie charts, percentages). Interpretation of Data and Paper Writing - Layout of a Research Paper, Journals in Computer Science, Impact factor of Journals, When and where to publish ? Ethical issues related to publishing, Plagiarism and Self-Plagiarism.

Unit V :

Use of Encyclopedias, Research Guides, Handbook etc., Academic Databases for Computer Science Discipline. Use of tools / techniques for Research: methods to search required information effectively, Reference Management Software like Zotero/Mendeley, Software for paper formatting like LaTeX/MS Office, Software for detection of Plagiarism.

Second Semester

CSC2C07: Design and Analysis of Algorithms

Course Number: 1

Contact Hours per Week: 4 (3 Lecture + 1 Tutorial)

Number of Credits: 4

Course Outcomes:

CO1: Illustrate algorithm design and model of computation

CO2: Design algorithm in context of space and time complexity and apply asymptotic notation

CO3: Model the correctness of algorithms using inductive proofs and invariants

CO4: Demonstrate the divide-and-conquer and Transform-and-Conquer techniques to explain when an algorithmic design situation calls for it.

CO5: Analyse the complexity of Greedy approach and Dynamic Programming

CO6: Interpret classes P, NP and NP Complete problems and familiarise problems in each category.

Unit I :

Introduction: Notion of Algorithm, Fundamentals of Algorithmic Problem Solving, Important Problem Types, Fundamental data Structures. Analysis Framework, Asymptotic Notations and Basic efficiency classes, Mathematical analysis of Recursive and Non-recursive algorithms, Master's theorem. Brute Force Approaches: Introduction, Selection Sort and Bubble Sort, Sequential Search and Brute Force String Matching.

Unit II :

Divide-and-Conquer: Mergesort, Quicksort, Binary Search, Strassen's Matrix Multiplication, Binary tree Traversals and related properties, median finding algorithm. Decrease-and-Conquer: Insertion Sort, Depth First and Breadth First Search, Topological sorting

Unit III :

Transform-and-Conquer: Introduction, Balanced Search Trees: AVL Trees, 2-3 Trees, Heaps and Heapsort. Greedy Method: The General Method, Huffman coding, Knapsack Problem, Job Sequencing with Deadlines, Minimum-Cost Spanning Trees: Prim's Algorithm, Kruskal's Algorithm; Single Source Shortest Paths.

Unit IV :

Dynamic Programming: The General Method, Warshall's Algorithm, Floyd's Algorithm for the All-Pairs Shortest Paths Problem, 0/1 Knapsack, The Traveling Salesperson problem. Backtracking: n-Queens problem, Hamiltonian Circuit Problem, Subset – Sum Problem. Branch-and-Bound: Assignment Problem, Knapsack Problem, Traveling Salesperson Problem.

Unit V :

Complexity: Complexity classes – P, NP, Co-NP-Hard and NP-complete Problems – Cook's theorem – NP-completeness reductions for clique, vertex cover, subset sum, Hamiltonian cycle, TSP, Integer programming Approximation algorithms – vertex cover, TSP, set covering and subset sum.

CSC2C08: Advanced Database Management System

Course Number: 2

Contact Hours per Week: 4 (3 Lecture + 1 Tutorial)

Number of Credits: 4

Course Outcomes:

CO1: Illustrate the basics of database system concepts, concepts of relational data model, entity-relationship model, relational database design, relational algebra and calculus

CO2: Apply the normalization techniques to improve the database design.

CO3: Describe various database manipulation commands in SQL.

CO4: Understand Transaction Processing Locking using the concept of Concurrency control.

CO5: Conceptualize advanced features of Object-Oriented Database Management Systems and Distributed databases.

Unit I :

Database System Concepts, Purpose of Database Systems, Views of Data - Data Abstraction, Instances and Schemes, Data Independence, Data Models. Relational Data Model - Relational Model concepts, keys, Integrity constraints - Domain Constraints, Key Constraints, Entity Integrity Constraints, Referential Integrity Constraints. ER Data Model- Design Issues, Entity Relationship Diagram, Weak Entity Sets, Extended ER Features, Design of an ER Database Schema, Reduction of an ER Schema to Tables. Relational Algebra-Selection and Projection, Set operations, Renaming, Joins, Division. Relational Calculus.

Unit II :

Relational database design - Design Principles, Normalization, Normal Forms - 1NF, 2NF, 3NF, BCNF, 4NF & PJNF, Domain Key Normal Form. Transactions -concepts, states of Transactions, ACID properties. Schedules - serial schedules, concurrent schedules, Serializability, Concurrency control protocols - Locking-Two-Phase Locking, Deadlock, Granularity, Timestamp Ordering Protocol.

Unit III :

Relational Database Query Languages - Basics of QBE , SQL –Data Definition Language(DDL), Data Manipulation Language(DML), Data Control Language(DCL) Commands, Basics of Query Processing. Data Definition in SQL - Data types, Creation, Insertion, Viewing, Updation, Deletion of tables, Renaming, Dropping of tables. Data Constraints - I/O constraints, Primary key, foreign key, unique key constraints, Database Manipulation in SQL - Select command, Logical operators, Range searching, Pattern matching, Grouping data from tables in SQL, GROUP BY, HAVING clauses, Joins. Views - Creation, Renaming the column of a view, DROP view.

Unit IV :

Program with SQL - Data types: Using set and select commands, Flow control constructs - if, if /else, while, goto. Global variables, Data types, Operators and Functions, Data Definition and Manipulation Statements, CodeBlocks, Stored Procedures- create, alter and drop, passing and returning data to stored procedures, using stored procedures within queries. Cursors - Working with cursors, Error Handling. User defined functions, implementing triggers.

Unit V :

Distributed Database systems- characteristics, architecture and challenges. Different approaches in database technologies - Object oriented and Object relational databases. Emerging trends in databases. Introduction to Big Data.

CSC2C09: Operating System Concepts

Course Number: 3

Contact Hours per Week: 4 (3 Lecture + 1 Tutorial)

Number of Credits: 4

Course Outcomes:

CO1: Understand the basic components of a computer operating system.

CO2: Apply the concept of Process & thread management.

CO3: Analyse the performance of memory allocation and replacement techniques.

CO4: Understand the concepts of protection and security in an OS

CO5: Identify the working principle of the UNIX operating system.

Unit I :

System software Overview: Operating system, I/O Manager, Assembler, Macro Processor Compiler and Interpreters, Linker, Loader. Fundamentals of OS: OS services and components, Different types of operating systems, multitasking, multiprogramming, time sharing, buffering, spooling.

Unit II :

Process & thread management: Concept of process and threads, process states, process management, context switching, interaction between processes and OS, multithreading. CPU Scheduling algorithms, Concurrency control: Concurrency and race conditions, mutual exclusion requirements , s/w and h/w solutions, semaphores, monitors, classical IPC problem and solutions , Dead locks -characterization , detection ,recovery, avoidance and prevention.

Unit III :

Memory management: Issues-Memory Allocation, Dynamic Relocation, various management strategies. Virtual memory, Paging: Issues and Algorithms. Segmentation: Typical implementations of paging and segmentation systems, Disk Scheduling. File Systems: File concept, File support, Access methods, Allocation methods, Directory systems, File Protection, Free Space management.

Unit IV :

Protection & security-Protection: Goals of protection, Domain of protection, Access matrix, Implementation of access matrix, Revocation of access rights .Security: the security problem, authentication, one-time passwords, program threats, System threats, Threat monitoring, Encryption. Case study of Microsoft Windows XP.

Unit V :

UNIX Operating System - UNIX Software architecture - Kernel, System calls, UNIX Command lines, Basic UNIX Commands, File System, Basics of UNIX Shell programming.

References:

CSC2C10: Object Oriented Programming with Java

Course Number: 4

Contact Hours per Week: 4 (3 Lecture + 1 Tutorial)

Number of Credits: 3

Course Outcomes:

CO1: Model object oriented programming concepts and develop Java programs that include basic constructs

CO2: Design and implement object-oriented programs including packages and interfaces.

CO3: Understand exception handling and debugging.

CO4: Develop GUI and applets for web based applications.

CO5: Describe socket programming, JDBC architecture and connectivity.

Unit I :

Introduction to Object Oriented Programming, Comparison with other programming paradigms, Java Basics: Java Programming environment, Structure of a java program, Life cycle of a java program, Java Virtual Machine, Byte code, Features of Java, fundamental programming structures in Java: comments, Primitive Data Types ,variables, Keywords, literals, variables scope & declarations, Control structures, Operators - Casts and Conversions, Arrays. Simple programs.

Unit II :

Data abstraction and Encapsulation - Objects and Classes: Predefined Classes - Defining Classes- Static Fields and Methods - Method Parameters - Object Construction- Packages. Inheritance: Classes - Super classes - Subclasses - Object: The Cosmic Superclass - Generic Array Lists -Object Wrappers and Auto-boxing - Reflection - Enumeration Classes. Interfaces and Inner Classes, Polymorphism: Overloading - Overriding.

Unit III :

Introduction to GUI: AWT Architecture - Light-Weight vs Heavy-Weight, AWT Event Hierarchy & Event Handling - Using Top-Levels - components and containers - Introduction to Layouts. Deploying Applets and

Applications: Applet Basics - The Applet HTML Tags and Attributes - Multimedia - The Applet Context - JAR Files - Application Packaging.

Unit IV :

Exceptions and Debugging: Dealing with Errors - Catching Exceptions - Using Exceptions, user defined Exceptions. Threads - Creating Threads, Runnable interface, Thread Class, Inter thread communication, Synchronization suspending, resuming and stopping threads. Multithreaded Programming. Streams and Files: The Complete Stream - ZIP File Streams - Use of Streams - Object Streams - File Management.

Unit V :

User Interface Components with Swing: Introduction to Layout Management - Text Input Choice Components - Menus - Sophisticated Layout Management - Dialog Boxes. Java library. Database Programming: JDBC - introduction, architecture, Drivers, connections, statements, resultset, Meta data and Query Execution. Sockets: Introduction to networking, InetAddress, url, socket, server sockets, Datagrams.

CSC2C11: Practical 2

Course Number: 5

Number of Contact Hours: 5 (10 Practical + 5 Tutorial)

Number of Credits: 3

Course Outcomes: *Construct programs relating to the theory portions covered in CS1CC10 Object Oriented Programming with Java and CS1CC08 Advanced Database Management System*

CO1: Use an integrated development environment to write, compile, run, and test simple object-oriented Java programs.

CO2: Understand Java programming concepts and utilize Java Graphical User Interface in program writing.

CO3: Design and develop Java programs that solve real-world problems.

CO4 Design and development of relational database systems.

CO5 Understand the use of various advanced queries execution such as relational constraints, joins, set operations, aggregate functions, trigger and views.

CO6 Describe the Use of various software to design and build ER Diagrams, UML, Flowchart for related database systems.

CO7 Apply JDBC to provide a program level interface for communicating with database using Java programming.

Unit I Java Programming:

Develop programs to implement the following:

1. Classes, objects and methods.
2. Inheritance of different types.
3. Use of keywords super, abstract and final.
4. Method overloading and Method overriding
5. Packages and interfaces.
6. Exception handling
7. Use of static members in a class.
8. File operations.
9. Multithreaded Programming

10. Applets
11. String handling
12. AWT to work with text and graphics
13. Applications of Swing.

Unit II Advanced DBMS:

Implement the following:

1. DCL, DDL, DML, DQL statements in MySQL
2. Stored Procedures in MySQL
3. Cursors and Triggers
4. Transactional and Locking statements
5. Account Management statements

CSC2E01: ARTIFICIAL INTELLIGENCE

Course Number: 6

Contact Hours per Week: 4 (3 Lecture + 1 Tutorial)

Number of Credits: 4

Course Outcomes:

CO1: Understand the basics of Artificial Intelligence and its applications.

CO2: Formalize the problem as a state space or graph

CO3: Apply search and game based techniques to solve state space problem assigned with heuristics.

CO4: Understand basic issues of knowledge representation techniques

CO5: Compare various machine learning methods.

CO6: Understand the basics of Genetic Algorithm and ANN.

Unit I :

Introduction: Artificial Intelligence- problems, scope and applications, Problem space and search- Production system- characteristics- the predicate calculus, Inference rules, Structures and strategies for state space search, strategies for space search, using state space to represent reasoning with the predicate calculus.

Unit II :

Heuristics Search: Control and implementation of state space search, Generate and test, Hill climbing, Depth first search, Breadth first search, Best-first search, A*, Problem Reduction, AO*, Constraint Satisfaction, Means-ends analysis, Heuristic in games, Complexity issues.

Unit III :

Game Playing - The Minimax search procedure, adding Alpha-beta cut-offs, Additional refinement, Iterative deepening, Planning system and its components, Understanding, Understanding as constrained satisfaction.

Unit IV :

Knowledge representation issues, representation and mappings, Representing simple facts in logic, Representing instances and ISA relationships, Computable functions and Predicates, Resolution, conversion to

clausal form, Unification algorithm, Natural deduction. Knowledge representation using rules, logic programming, forward versus backward reasoning, Symbolic reasoning under uncertainty- Nonmonotonic reasoning, Slot and filler structures: Semantic nets, frames, conceptual dependency, scripts.

Unit V :

Machine Learning - rote learning, learning by taking advice, learning in problem solving, learning from examples, Explanation based learning, Analogy, formal learning theory, Connectionist models- Hopfiled networks, learning in neural networks, back propagation, applications of neural networks, Genetic algorithm, classifier systems and genetic programming, artificial life and society based learning.

CSC2E02: INFORMATION THEORY AND CODING

Course Number: 6

Contact Hours per Week: 4 (3 Lecture + 1 Tutorial)

Number of Credits: 4

Course Outcomes:

CO1: Apply information theory in source coding and channel coding

CO2: Model various error control encoding and decoding techniques

CO3: Analyze the performance of error control codes

CO4: Illustrate the concept of discrete two dimensional linear processing

Unit I :

Information Theory: Information and entropy, source encoding, Noiseless coding, Shannon's first fundamental theorem, Sources with finite memory: Markov sources, Discrete channel with discrete, Shannon's second fundamental theorem on coding for memory less noisy channel, Discrete channel with continuous noise, continuous channel with continuous noise, Channel capacity theorem, Properties.

Unit II :

Waveform Coding Techniques: PCM Channel noise and error probability DPCM and DM Coding speech at low bit rates Prediction and adaptive filters. Base band shaping for Data transmission, PAM signals and their power spectra Nyquist criterion ISI and eye pattern Equalization

Unit III :

Error control coding: Galois fields, Vector spaces and metrics, Block codes, Binary Cyclic codes, Multiple error correcting codes, Majority - logic decoding, convolutional codes, Burst error correcting codes, ARQ, Performance of codes.

Unit IV :

Digital Modulation Techniques: Binary and M-ary modulation techniques, Coherent and non-coherent detection, Bit Vs symbol error probability and bandwidth efficiency. Bit error analysis, using orthogonal Signaling.

Unit V :

Discrete two dimensional linear processing: super position and Convolution, Finite area superposition and convolution, Circulant superposition and convolution, Unitary transforms, Generalized unitary transforms, Fourier transforms, Cosine, Sine & Hartely transforms, Hadamard, Har walsh hadamard, Karhanen- Loeve transforms, Linear processing techniques: Transform domain processing, transformed domain superposition, Fast Fourier Transformation convolution, Fourier transform filtering.

CSC2E03: COMPUTER GRAPHICS

Course Number: 6

Contact Hours per Week: 4 (3 Lecture + 1 Tutorial)

Number of Credits: 4

Course Outcomes:

CO1: Illustrate the working of different display devices.

CO2: Understand the fundamentals of computer graphics

CO3: Interpret line drawing algorithms and 2D transformations

CO4: Model different clipping algorithms

CO5: Familiarize projection, Curves & Fractals.

CO6: Analyze different Color & shading Models.

Unit I :

Introduction, application and output devices for computer graphics: raster and random scan display, CRT, color CRT, flat panel, LCD, LED, DVST. Adapters; monochrome display adapter (MDA), CGA, hercules graphics card, enhanced graphics adapter, Professional graphics adapter, VGA, SVGA. Graphics software: GKS, PHIGS, OpenGL. Scan conversion: Points & lines, line drawing algorithms; DDA algorithm, Bresenham's line algorithm Circle generation algorithm Mid -Point Circle algorithm, Ellipse generating.

Unit II :

Filling, Clipping & Transformation (2D& 3D): Area scan conversion, seed fill algorithm ,scan line polygon fill algorithm ,Inside Outside test, Boundary fill algorithm ,Flood fill algorithm, Character generation. Anti-aliasing. Clipping operations, Cohen Sutherland line clipping, Liang Barsky line clipping, Nicholl Lee line clipping, polygon clipping, Sutherland Hodgeman & Weiler Atherton polygon clipping, Text clipping. Transformation: Geometric & coordinate transformation, Inverse transformation, Composite transformation, Translation, rotation, scaling, shearing, reflection.

Unit III :

Projection: 3D concepts & viewing pipeline, coordinate system, window to viewport coordinate Transformation, parallel & perspective projection, projection matrix, view volume. 3D object representation: wire-frame model, visible surface detection methods, depth comparison, Z-buffer algorithm, back face detection, BSP tree method, painter's algorithm, depth cueing.

Unit IV :

Curves & Fractals: curve representation, surfaces, designs, spline representation, Bezier curves, cubic spline, beta spline, B-spline curves. Fractal's geometry, fractal generation procedure, classification of fractal, fractal dimension, fractal construction methods.

Unit V :

Color & shading Models: Introduction, modelling light intensities and sources, diffuse reflection, Lambert's cosine law, specular reflection, half-toning, dithering, color model - XYZ, RGB, YIQ, CMY & HSV, shading algorithm & model, illumination model, gouraud shading, phong shading. OpenGL programming: Introduction, primitives drawing, colouring, transformation, filling, curve.

CSC2E04: ADVANCED MICRO PROCESSORS AND MICRO CONTROLLER

Course Number: 6

Contact Hours per Week: 4 (3 Lecture + 1 Tutorial)

Number of Credits: 4

Course Outcomes:

CO1: Illustrate the generalized architecture of microprocessors and advanced microcontrollers

CO2: Develop algorithm/program of the advanced microcontrollers for a particular task

CO3: Interface advanced microcontrollers with external peripherals

Unit I :

8085 microprocessor - Architecture: Block diagram-addressing modes-instruction set-basic programs- stacks and subroutines-interrupts-machine cycles-time delays.

Unit II :

8086 microprocessor - Architecture: Block diagram-real mode memory addressing-addressing modes: data addressing, program memory, addressing, stack memory addressing-instructions: data movement instructions, arithmetic logic instructions, program control instructions-basic programs-procedures.

Unit III :

Interrupts-types 8086 interrupts and interrupt responses-interrupt vector table-8259 PIC-interrupt applications: INT 09H and keyboard buffer-INT 21H operations for screen display and keyboard input- INT10H and 16H operations for video and keyboard.

Unit IV :

Peripherals-memory interface-8255PPI-8254 PIT-8237 DMA controller-8279 keyboard and display controllers.

Unit V :

Intel 8051 Micro controller- Architecture-basic instructions-basic assembly language programs- peripherals: interrupts, timers, parallel port, serial port.

CSC2E05: NUMERICAL AND STATISTICAL METHODS

Course Number: 6

Contact Hours per Week: 4 (3 Lecture + 1 Tutorial)

Number of Credits: 4

Number of Credits: 4

Course Outcomes:

CO1: Understand the basics of approximations and errors in computing.

CO2: Apply different methods of interpolation for prediction.

CO3: Employ the concepts of solving integrals numerically.

CO4: Model different definitions of probability and its properties.

CO5: Solve specialized linear programming problems like the transportation and assignment problems.

Unit I :

Approximation and errors in computing - introduction, significant digits - inherent errors - numerical error - modeling errors - blunders - absolute and relative errors - conditioning and stability. Roots of non-linear equations - introduction - iterative methods - bisection - false position - Newton - Raphson's, Secant and Bairstow's methods.

Unit II :

Introduction solution of linear equations - Gauss elimination - Gauss-Jordan method - Jacobi Iteration method - Gauss-Seidal methods. Interpolation - linear interpolation - Newton's forward backward & divided difference interpolation methods - Lagrange's method.

Unit III :

Integration - trapezoidal rule, Simpson's 1/3, & 3/8 rules. Differential equations: Heunn's polygon, Range-Kutta fourth order, Milne-Simpson, Adams-Bashforth and Adams-Moulton methods.

Unit IV :

Classical definition of probability - statistical definition of probability - axiomatic approach to probability - addition and multiplication theorem on probability - compound and conditional probability - independence

of events - Bayes theorem random variables - discrete and continuous - pmf, pdf and distribution functions.

Unit V :

Introduction linear programming - mathematical formulation - graphical method of solution - simplex method - duality - dual simplex - transportation - assignment problems.

CSC2E06:: DISTRIBUTED COMPUTING

Course Number: 6

Contact Hours per Week: 4 (3 Lecture + 1 Tutorial)

Number of Credits: 4

Course Outcomes:

CO1: Model the concepts and issues related to distributed systems.

CO2: Design and develop the programs for distributed environment.

CO3: Manage performance, reliability and other issues while designing in distributed environment.

Unit I :

Operating system fundamentals - distributed system concepts and architectures - major design issues - distributed computing environments (DCE).

Unit II :

Concurrent processes and programming - threads and processes - client server model – time services language mechanisms for synchronization - concurrent programming languages.

Unit III :

Inter-process communication and coordination - message passing communication - request/reply communication - transaction communication -name and directory services - distributed mutual exclusion - leader election.

Unit IV :

Distributed process scheduling - static process scheduling, dynamic load sharing and balancing – distributed process implementation.

Unit V :

Real-time scheduling - concepts of distributed file systems - distributed shared memory - distributed computer security

CSC2E07: SIMULATION AND MODELING

Course Number: 6

Contact Hours per Week: 4 (3 Lecture + 1 Tutorial)

Number of Credits: 4

Course Outcomes:

CO1: Illustrate concept, principles of mathematical modeling and discrete system simulation.

CO2: Analyse various techniques for evaluation of simulation experiments

CO3: Employ the concept of simulation of queueing systems and stochastic network

Unit I :

Introduction - systems and models - computer simulation and its applications -continuous system simulation - modeling continuous systems - simulation of continuous systems - discrete system simulation - methodology - event scheduling and process interaction approaches - random number generation.

Unit II :

Testing of randomness - generation of stochastic variates - random samples from continuous distributions - uniform distribution - exponential distribution -m-Erlang distribution - gamma distribution - normal distribution - beta distribution - random samples from discrete distributions Bernoulli - discrete uniform -binomial - geometric and poisson.

Unit III :

Evaluation of simulation experiments - verification and validation of simulation experiments - statistical reliability in evaluating simulation experiments -confidence intervals for terminating simulation runs - simulation languages -programming considerations - general features of GPSS-SIM SCRIPT and SIMULA.

Unit IV :

Simulation of queueing systems - parameters of queue - formulation of queueing problems - generation of arrival pattern - generation of service patterns -Simulation of single server queues - simulation of multi-server queues -simulation of random queues.

Unit V :

Simulation of stochastic network - simulation of PERT network - definition of network diagrams forward pass computation - simulation of forward pass -backward pass computations - simulation of backward pass - determination of float and slack times determination of critical path - simulation of complete network - merits of simulation of stochastic networks.

CSC2A02: Term Paper

Course Number: 7

Number of Credits: 2

Course Outcomes:

CO1: Apply critical thinking and analytical ability in problem solving.

CO2: Practice the research methodology for literature survey.

CO3: Apply foundational research skills to address a research problem.

CO4: Innovate, experiment and analyze research findings.

CO5: Demonstrate capacity to lead and manage change through collaborative environment.

CO6: Practice the process of presenting the research work through seminars/conferences and scientific publishing.

A term paper is introduced in the second semester with the following objectives.

- To familiarize the student to the techniques of literature survey and to conduct a study/analysis result in a critical review of the recent research work/technology innovations related to Computer Science.
- To acquaint with the process of presenting the work through seminars and technical reports.

The student is expected to do an extensive literature survey and analysis in a research/innovations/technology area related to Computer Science, under the supervision of a faculty member from the Department. The student has to choose an area/topic for his/her work after due consultation and approval from the guide (students can refer articles from ACM/IEEE/INFLIBNET Journals/Conference Proceedings and/or equivalent documents, standard textbooks and web based material, approved by the supervisor)

The study should preferably result in a critical review of the recent research works/technology advancements/ innovations/ algorithms/theoretical contributions in the form of theorems and proofs/new methods of proof/new techniques or heuristics with analytical studies/implementations and analysis of results.

The student should give a seminar on his/her work, during the semester, and submit a technical report.

Evaluation: For the evaluation of the term paper, an evaluation committee is to be constituted. One faculty is to be designated as the Course Coordinator for this course. Committee is to be constituted by the Head of the Department (HOD) and (s)he shall be the Chairperson of the committee. In addition to the HOD, the Course Coordinator, the faculty guiding a particular student will also be a member of the committee. The Coordinator has to set the schedule for presentation and submission of the reports. While calculating the final score, 25% weight is to be given for the scores awarded by the guide to the student and the rest 75% weight is to be given for the average of the scores awarded to the student by remaining committee members.

A tentative list of the components for evaluation of Term Paper is as shown below. Evaluation committee can decide about the actual composition of the components and scores to be awarded for each component.

Components:

- Relevance of the Topic, Statement of Objectives, Correctness
- Quality of Literature Survey / Analysis of results
- Methodology / Tools adopted
- Quality of Implementation/Simulation /Testing
- Identification of Future Work
- Quality of the Term Paper Report
- Quality of Presentation
- Publications out of the Term Paper

Third Semester

CSC3C12: PRINCIPLES OF COMPILER DESIGN

Course Number: 1

Contact Hours per Week: 4 (3 Lecture + 1 Tutorial)

Number of Credits: 4

Course Outcomes:

CO1: Model the process of translating a high-level language to an executable code.

CO2: Describe how different phases of a compiler work.

CO3: Experiment top down and bottom up parsing algorithms.

CO4: Apply flow graph for the intermediate codes.

CO5: Apply optimization techniques to have a better code for code generation.

Unit I :

Introduction to compiling : Compilers - Analysis of the source program - Phases of a compiler - Cousins of the Compiler - Grouping of Phases - Compiler construction tools - Lexical Analysis - Role of Lexical Analyzer - Input Buffering - Specification of Tokens.

Unit II :

Syntax analysis : Role of the parser - Writing Grammars - Context-Free Grammars - Top Down parsing - Recursive Descent Parsing - Predictive Parsing - Bottom-up parsing - Shift Reduce Parsing - Operator Precedent Parsing - LR Parsers - SLR Parser - Canonical LR Parser - LALR Parser.

Unit III :

Intermediate code generation: Intermediate languages - Declarations - Assignment Statements - Boolean Expressions - Case Statements - Back patching - Procedure calls.

Unit IV :

Code generation: Issues in the design of code generator - The target machine - Runtime Storage management - Basic Blocks and Flow Graphs - Next-use Information - A simple Code generator - DAG representation of Basic Blocks - Peephole Optimization.

Unit V :

Code optimization and run time environments : Introduction - Principal Sources of Optimization - Optimization of basic Blocks - Introduction to Global Data Flow Analysis - Runtime Environments - Source Language issues - Storage Organization - Storage Allocation strategies - Access to non-local names - Parameter Passing.

CSC3C13: DATA COMMUNICATION AND NETWORKING

Course Number: 2

Contact Hours per Week: 4 (3 Lecture + 1 Tutorial)

Number of Credits: 4

Course Outcomes:

CO1: Illustrate the basics of data and signal.

CO2: Familiarize with OSI reference model.

CO3: Identify protocols at different layers.

CO4: Understand an overview on various LAN architectures.

CO5: Practice the concepts of computer network security.

Unit I :

Data and signals -Analog and Digital signals, Line configuration, Topology, Transmission mode, Guided and Unguided media, Parallel and Serial data transmission, Layered approaches-OSI and TCP/IP. Multiplexing. Transmission impairments-Distortion, Attenuation, Noise. Analog modulation- AM, PM, FM. Sampling theorem, Analog pulse modulation, Digital pulse modulation. ASK, FSK, PSK and PSK. Digital data transmission and Interface standards. DTE and DCE. Modems.

Unit II :

DataLinkLayers - ErrorDetection and Correction. DataLinkControl - lineDiscipline, flow control, error control .Data link Protocol-synchronous and asynchronous protocol, character oriented and Bit Oriented protocol. Multi Access Protocols- ALOHA and CSMA. Switching. Networking and Internetworking devices-Repeaters, Bridges, Routers and Gateways.

Unit III :

LANs: Project802-Ethernet, token bus, token ring. Bluetooth-architecture, layers, radio layer, baseband layers. L2CAP and upper layers. FDDI. MANs-IEEE802.6. SMDS. Network layer address and protocol- ARP, IP, ICMP, IGMP.IPv4 and IPv6.Subnetting.ISDNlayers and BISDN. X.25layers, packet layers protocol. Frame relay layers. ATM-design topology, protocol, architecture. Routing algorithms.

Unit IV :

SONET/SDH-Configuration, Layers, Frames. Transport Layer- Design Issues, Connection Management, Transmission Control Protocol (TCP), User Datagram Protocol (UDP). Session layer. Presentation layer-Protocols, Compression, Translation. Application layer- Protocols, DNS, Telnet. www and HTTP.

Unit V :

Computer Network Security- Introduction, Need for security, Principles of Security, Types of Attacks. Symmetric and Public key algorithms. Authentication. Integrity. Key Distribution and Certification.

CSC3C14 - WEB TECHNOLOGY

Course Number: 3

Contact Hours per Week: 4 (3 Lecture + 1 Tutorial)

Number of Credits: 3

Course Outcomes:

CO1: Practice the concepts of Web programming including HTML5 futures and tag set.

CO2: Practice server side and client side scripting.

CO3: Develop applications using JSP scripting elements by Linking to external files and Accessing databases from JSP.

CO4: Develop applications with advanced features of PHP by establishing connection with MySQL databases.

CO5: Analyze server side programming with Python.

Unit I :

Introduction to Web programming - Introduction to SGML features - HTML, XHTML, DHTML, XML - HTML Vs XML - Creating XML documents - Parsing an XML document - Writing well formed documents - Organizing elements with namespaces - Defining elements in a DTD - Declaring elements and attributes in a DTD. Familiarization of HTML5 futures and tag set.

Unit II :

Introduction to scripting - server side and client side scripting. CGI/Perl: Creating link to a CGI Script - Using a link to send data to a CGI Script - parsing data sent to a Perl CGI script - Using CGI script to process form data - Using scalar variables in Perl - Using variables in Perl - Using arithmetic operators in Perl - arrays, list, hashes, strings, pattern and regular expressions, text processing, subroutines - Associating a form with a script-

Unit III :

Java Server Pages - JSP scripting elements - Linking to external files - JSP declarations - JSP Expressions - JSP Scriptlets - Processing client requests- Accessing a database from JSP. Advantages of JSP comparing with other language.

Unit IV :

PHP: Advanced features of PHP, Defining PHP variables - variable types - operators - control flow constructs in PHP- Function, Creating a Function, Function Libraries, Arrays, strings and Regular Expressions, GET and POST methods - Establishing connection with MySQL database - managing system data - parsing data between pages

Unit V :

Python: Introduction to Python language, Advantages of Python in comparison with other Languages, Data types, control structures, advanced data structures, I/O, defining classes, data collections, functions and modules (math module), packages, exception handling, standard library, internet programming with python.

CSC3E08: DIGITAL IMAGE PROCESSING

Contact Hours per Week: 4 (3 Lecture + 1 Tutorial)

Number of Credits: 4

Course Outcomes:

CO1: Practice application of digital image processing.

CO2: Familiarize image sampling and quantization techniques.

CO3: Examine image transformation techniques viz. Fourier transform, Walsh Hadamard, DCT, and Hotelling transform.

CO4: Examine image enhancement techniques - histogram processing and various image filters viz. laplacian filter, smoothing and sharpening filters, spatial filters, and homomorphic filters.

CO5: Understand Image restoration process, noise models and inverse filtering Techniques.

CO6: Understand Edge detection, region based segmentation and boundary representation

CO7: Familiarise various Image compression models - information theoretic perspective.

Unit I :

Introduction - digital image representation - fundamental steps in image processing - elements of digital image processing systems - digital image fundamentals - elements of visual perception - a simple image model - sampling and quantization - basic relationship between pixels - image geometry

Unit II :

Image transforms - introduction to Fourier transform - discrete Fourier transform (DFT) - properties DFT- other separable image transforms - Walsh, Hadamard and Discrete Cosine transforms. Hotelling transform.

Unit III :

Image enhancement - basic grey level transformation - histogram equalization - image subtraction - Image averaging - spatial filtering - smoothing, sharpening filters - Laplacian filters. Enhancement in the frequency domain - frequency domain filters - smoothing, sharpening filters - homomorphic filtering.

Unit IV :

Image restoration - model of Image degradation/restoration process - noise models - inverse filtering - least mean square filtering - constrained least mean square filtering. Edge detection - thresholding - region based segmentation - Boundary representation

Unit V :

Image compression - fundamental concepts of image compression - compression models - information theoretic perspective. Lossless compression - Huffman coding - arithmetic coding - bit plane coding - run length coding. Lossy compression - transform coding - Image compression standards.

CSC3E09 - WIRELESS AND SENSOR NETWORKS

Contact Hours per Week: 4 (3 Lecture + 1 Tutorial)

Number of Credits: 4

Course Outcomes:

CO1: Understand the fundamental concepts of wireless sensor networks.

CO2: Illustrate the WSN architecture, Hardware Components, Energy Consumption of Sensor Nodes.

CO3: Describe the Operating Systems and Execution Environments, Network Architecture, Optimization Goals, Figures of Merit and Gateway Concepts.

CO4: Analyze networking sensors, MAC Protocols for Wireless Sensor Networks and Routing Protocols.

CO5: Analyse infrastructure Establishment viz Topology Control, Clustering, Time Synchronization, Localization and Positioning, Sensor Tasking and Control.

CO6: Understand Sensor Network Platforms and Tools.

Unit I :

Over view of wireless sensor networks- Challenges for Wireless Sensor Networks, Enabling Technologies for Wireless Sensor Networks.

Unit II :

Architectures- Single-Node Architecture - Hardware Components, Energy Consumption of Sensor Nodes , Operating Systems and Execution Environments, Network Architecture - Sensor Network Scenarios, Optimization Goals and Figures of Merit, Gateway Concepts.

Unit III :

Networking Sensors-Physical Layer and Transceiver Design Considerations, MAC Protocols for Wireless Sensor Networks, Low Duty Cycle Protocols and Wakeup Concepts - S-MAC, The Mediation Device Protocol, Wakeup Radio Concepts, Address and Name Management, Assignment of MAC Addresses, Routing Protocols- Energy-Efficient Routing, Geographic Routing.

Unit IV :

Infrastructure Establishment-Topology Control, Clustering, Time Synchronization, Localization and Positioning, Sensor Tasking and Control.

Unit V :

Sensor Network Platforms and Tools - Sensor Node Hardware - Berkeley Motes, Programming Challenges, Node-level software platforms, Node-level Simulators, State-centric programming.

CSC3E10 - CRYPTOGRAPHY AND NETWORK SECURITY

Contact Hours per Week: 4 (3 Lecture + 1 Tutorial)

Number of Credits: 4

Course Outcomes:

CO1: Understand the fundamentals of cryptography.

CO2: Interpret data integrity, authentication, digital signatures.

CO3: Analyze different network security applications

CO4: Describe standard algorithms that provide confidentiality, integrity and authenticity.

CO5: Understand network security technologies.

Unit I :

Computer security concepts - challenges - security attacks - security services - security mechanisms - a model for network security. Cryptography - symmetric encryption principles - cryptography - cryptanalysis - Feistel Cipher structure. Symmetric block encryption algorithms - DES - Triple DES - AES - random and pseudorandom numbers - stream cipher and RC4 - cipher block modes of operation.

Unit II :

Message authentication - approaches - MAC - one way Hash function - secure Hash functions - Message Authentication Codes. Public key cryptography principles - algorithms - digital Signatures.

Unit III :

Network security applications - symmetric key distributions using symmetric encryption - Kerberos version 4 - key distributions using asymmetric encryption - X.509 certificates -public key infrastructure - federated identity management.

Unit IV :

Transport level security - web security considerations - secure socket layer and transport layer security - SSL architecture - SSL record protocol - change cipher spec protocol - handshake protocol. Transport layer security - HTTPS - SSH. IP Security - overview - policy - encapsulating security payload - combining security associations - internet key exchange.

Unit V :

Intruders - intruders, intrusion detection, password management. Malicious software - types, viruses, countermeasures, worms, DDoS. Firewalls - need - characteristics, types, firewall basing, location and configuration - DMZ networks, VPN - distributed firewalls.

CSC3E11-REMOTE SENSING AND GIS

Contact Hours per Week: 4 (3 Lecture + 1 Tutorial)

Number of Credits: 4

Course Outcomes:

- CO1:** Understand types and chronological development - ideal and real- remote sensing system.
- CO2:** Compare conventional survey, aerial remote sensing and satellite remote sensing
- CO3:** Understand the energy sources - electromagnetic radiation - energy interaction with earth surface features and spectral reflectance patterns for different regions of EMR.
- CO4:** Model GIS and spatial data- Definition, computer assisted mapping and analysis. -
- CO5:** Understand GPS coordinate system, Terminologies measurements of lengths, perimeter and area in GIS.
- CO6:** Practice various Raster and vector overlay methods
- CO7:** Understand Maps as output, and maps as decision tools.

Unit I :

Fundamentals: Definition - scope - types and chronological development - ideal and real remote sensing system. Comparison of conventional survey, aerial remote sensing and satellite remote sensing - advantage and limitation of satellite remote sensing. EMR and Remote Sensing: Energy sources - electro magnetic radiation - spectral regions - energy interaction in the atmosphere - atmosphere window - energy interaction with earth surface features -spectral reflectance patterns for different region of EMR. Actors affecting remote sensing signatures. Platforms- data capture types and systems - data recording methods.

Unit II :

GIS and spatial data- Definition - maps spatial information - computer assisted mapping and analysis - components of GIS -people and GIS - maps and spatial data - thematic characteristics of spatial data ad GPS coordinate system- other sources of spatial data; census ad survey data, air photos, satellite images, field data. Data analysis operations

in GIS, Terminologies measurements of lengths, perimeter and area in GIS - queries - reclassification buffering and neighborhood functions - integrated data.

Unit III :

Raster and vector overlay method: point-in-polygon and polygon and polygon-on- polygon problems of raster and vector overlays - spatial interpolation - GIS for surface analysis - network analysis: shortest path problem, location - allocation of resources - route tracking. Models of spatial processes: natural and scale analogue models - conceptual models - mathematical model - models of physical and environmental processes. Maps as output - alternative cartographic outputs - non-cartographic outputs - spatial multimedia - delivery mechanism - GIS and spatial decision supports -maps as decision tools.

Unit IV :

Remote sensing data: types - digital, analogue - fluvial land forms - drainage pattern - erosional and depositional landforms - flood plain mapping - coastal landforms - erosional and depositional features - glacial landforms.

Unit V :

Land use/land cover: Corp assessment, disease detection, forestry: types - species identification and diseases detection. Soils: soil mapping - soil moisture - soil erosion - reservoir station - soil salinity - soil conservation. Water resources: surface water resources - water quality monitoring and mapping - water pollution, identification of ground water potential recharge areas - integrated watershed development.

CSC3E12 - DIGITAL IMAGE FORENSICS

Contact Hours per Week: 4 (3 Lecture + 1 Tutorial)

Number of Credits: 4

Course Outcomes:

CO1: Understand image formation, sensor operations and compression.

CO2: differentiate the image file formats.

CO3: Understand the passive and active categories of forensics.

CO4: Describe the forensic techniques based on natural image statistics.

CO5: Identify Practical Considerations and counter forensics.

Unit I :Background on Digital Images

Digital Camera Image Formation, Introduction and Hardware, Optical Imaging Path, Taking Lens, Antialiasing Filter, Infrared Cutoff Filter, Cover Glass, Sensor Optics, Image Sensor Operation and Artifacts, CCD Sensor Operation, CMOS Sensor Operation, Sensor Artifacts, Video Capture, Subsampling, Binning, Exposure Control, Processing and Storage, Nominal Image Processing Chain, Raw CFA Image, Camera Corrections, Stochastic Noise Reduction, Exposure and White Balance Correction, Adjusted CFA Image, Demosaicing, Interpolated RGB Image, Color Noise Reduction, Color Correction, Tone Scale and Gamma Correction, Edge Enhancement, Finished Image, Compression, Storage Formatting, Exif - JPEG, TIFF/EP, Post-Processing Enhancement Algorithms, Statistical Techniques, Wavelet-Based Compression, JP2 File Format

Unit II :Digital Image Formats

Searching and Extracting Digital Image Evidence, File Systems and Fragmentation, FAT and NTFS File System, File allocation, deletion and recovery, Fragmentation, Low Disk Space, Appending/Editing of Files, Wear - Leveling Algorithms in Next Generation Devices, File System Forced Fragmentation, File Carving, Carving Non-fragmented Files, Carving Bifragmented Files, Graph Theoretic Carving, Reassembly as Hamiltonian Path Problem, Reassembly as k-Vertex Disjoint Path Problem, Parallel Unique Path, Shortest Path First, SmartCarver, Pre-processing, Collation, Reassembly, Keyword or Dictionary-Based Techniques, Sequential Fragmentation Point Detection.

Unit III : Techniques Attributing an Image to Its Source

Image and Video Source Class Identification, Multimedia Forensics, Passive Forensics and Source Identification, Source Category Identification, Lens Distortion Features, Demosaicing Regularity, Other Statistical Features, Software Tools Identification, Forensics Learning Techniques, Feature Reduction Techniques, Classification Techniques, Fusion Techniques, Anti-Forensics and Countermeasures, Sensor Defects in Digital Image Forensic, Imaging Sensors and Their Defects, Sensor Fingerprint, Digital Forensics Using Sensor Fingerprint, Fighting the Fingerprint - Copy Attack, Temporal Forensics, Source Attribution Based on Physical Defects in Light Path, Forensic Use of Sensor Dust, Forensic Use of Scratches in Scanners

Unit IV : Techniques Verifying the Integrity and Authenticity of Image Evidence

Techniques Verifying the Integrity and Authenticity of Image Evidence, Natural Image Statistics, Image Representation, Features Based on Regularities, Natural Versus Synthetic Using Image Features, Application to Digital Image Forensics, Photographic Versus Photorealistic, Generic Image Steganalysis, Live or Rebroadcast, Detecting Doctored Images, World, Lens, Sensor, Processing, Image, Discrimination of Computer Synthesized or Recaptured Images from Real Images, Visual Realism of Computer Graphics, Visual Realism of Recaptured Image, Statistics of Computer Graphics and Recaptured Images, Automatic Detection Using Computer, Pattern Recognition System and Design Issues, Evaluation Metric, Approaches for Photorealistic Computer Graphics Detection, Approaches for Recaptured Image Detection.

Unit V : Digital Image Forensics in Practice

Courtroom Considerations in Digital Image Forensics, Computer Forensics, Knowledge, Possession, Control, Expert Testimony, Discovery, Exhibits, Counter-Forensics, Image Generation, Practical Considerations, Epistemic Bounds, Image Models, Blurred Notion of Authenticity, Classification of Counter-Forensic Techniques, Robustness Versus Security, Integrated and Post-Processing Attacks, Targeted and Universal Attacks, Selected Targeted Attacks, Suppressing Traces of Image Processing, Adding Traces of Authentic Images, Relations to Steganography and Digital Watermarking, Countering Counter - Forensics: An Open Challenge

Text Book:

CSC3E11 - SOFT COMPUTING TECHNIQUES

Contact Hours per Week: 4 (3 Lecture + 1 Tutorial)

Number of Credits: 4

Course Outcomes:

CO1: Understand the fundamental concepts of soft computing techniques.

CO2: Understand basics of computing paradigm known as genetic algorithms

CO3: Describe various neural network models and its applications.

CO4: Analyze the applications of fuzzy set theories.

CO5: Build EC algorithms and understand the swarm intelligence.

Unit I :

Introduction - introduction to statistical - syntactic and descriptive approaches - features and feature extraction - learning - Bayes Decision theory - introduction - continuous case - 2- category classification - minimum error rate classification - classifiers - discriminant functions - and decision surfaces - error probabilities and integrals - normal density - discriminant functions for normal density.

Unit II :

Introduction to Genetic Algorithm, Genetic Operators and Parameters, Genetic Algorithms in problem Solving, Theoretical Foundations of Genetic Algorithms, Implementation Issues - systems

Unit III :

Neural Model and Network Architectures, Perceptron Learning, Supervised Hebbian Learning, Back-propagation, Associative Learning, Competitive Networks, Hopfield Network, Computing with Neural Nets and applications of Neural Network.

Unit IV :

Introduction to Fuzzy Sets, Operations on Fuzzy sets, Fuzzy Relations, Fuzzy Measures, Applications of Fuzzy Set Theory to different branches of Science and Engineering.

Unit V :

Advanced Topics: Support Vector Machines, Evolutionary computation (EC)- Evolutionary algorithms, Harmony search, Swarm intelligence.

CSC3E14 - DATA WAREHOUSING AND DATA MINING

Contact Hours per Week: 4 (3 Lecture + 1 Tutorial)

Number of Credits: 4

Course Outcomes:

CO1: Identify the scope and necessity of Data Mining and Warehousing for the society

CO2: Understand data quality and methods and techniques for preprocessing of data.

CO3: Analyze the patterns that can be discovered by classification and clustering.

CO4: Understand data mining techniques clustering and association rule mining

CO5: Identify complex data types with respect to spatial and web mining.

Unit I :

Data warehouse - definition - operational database systems Vs data warehouses - multidimensional model - from tables and spreadsheets to Data Cubes - schemas for multidimensional databases - measures - concept hierarchies - OLAP operations in the multidimensional data model - data warehouse architecture.

Unit II :

Data mining - introduction - definition - data mining functionalities - major issues in data mining - data preprocessing - data cleaning - data integration and transformation - data reduction - data discretization and concept hierarchy generation. Association rule mining - efficient and scalable frequent item set mining methods - mining various kinds of association rules - association mining to correlation analysis - constraint-based association mining.

Unit III :

Classification and prediction - issues regarding classification and prediction - classification by decision tree introduction - Bayesian classification - rule based classification - classification by back propagation - support vector machines - associative classification - lazy learners - other classification methods - prediction - accuracy and error measures - evaluating

the accuracy of a classifier or predictor - ensemble methods - model selection.

Unit IV :

Cluster analysis - types of data in cluster analysis - a categorization of major clustering methods - partitioning methods - hierarchical methods - density-based methods - grid-based methods - model-based clustering methods - clustering high dimensional data - constraint-based cluster analysis - outlier analysis.

Unit V :

Graph mining - mining object, spatial, multimedia, text and web data - multidimensional analysis and descriptive mining of complex data objects - spatial data mining - multimedia data mining - text mining - mining the World Wide Web.

CSC3E15 - INFORMATION RETRIEVAL SYSTEMS

Contact Hours per Week: 4 (3 Lecture + 1 Tutorial)

Number of Credits: 4

Course Outcomes:

CO1: Practice the fundamentals of information retrieval systems and its taxonomy.

CO2: Illustrates the basic information retrieval systems and its evaluation strategies.

CO3: Understand the multimedia inputs and multimedia Information retrieval systems.

CO4: Modeling of information retrieval systems for search engines.

Unit I :

Introduction: Information versus Data Retrieval, IR: Past, present, and future. Basic concepts: The retrieval process, logical view of documents. Modeling: A Taxonomy of IR models, ad-hoc retrieval and filtering. Classic IR models: Set theoretic, algebraic, probabilistic IR models, models for browsing.

Unit II :

Retrieval evaluation: Performance evaluation of IR: Recall and Precision, other measures, Reference Collections, such as TREC, CACM, and ISI data sets. Query Languages: Keyword based queries, single word queries, context queries, Boolean Queries, Query protocols, query operations.

Unit III :

Text and Multimedia Languages and properties, Metadata, Text formats, Markup languages, Multimedia data formats, Text Operations. Indexing and searching: Inverted files, Suffix trees, Suffix arrays, signature files, sequential searching, Pattern matching.

Unit IV :

Multimedia IR: Spatial access methods, Generic multimedia Indexing approach, Distance functions, feature extraction, Image features and distance functions. Searching the Web: Characterizing and measuring the Web.

Unit V :

Search Engines: Centralized and Distributed architectures, user Interfaces, Ranking, Crawling the Web, Web directories, Dynamic search and Software Agents. Information System Evaluation: Introduction, Measures used in system evaluation, Measurement example - TREC results.

CSC3E16 - DATA ANALYTICS WITH PYTHON

Contact Hours per Week: 4 (3 Lecture + 1 Tutorial)

Number of Credits: 4

Course Outcomes:

CO1: Understand the overview of data analytics in the context of machine learning and artificial intelligence

CO2: Experiment exploration through python by familiarising packages necessary to perform various data analytics tasks.

CO3: Design various machine learning algorithms

CO4: Apply data preparations and analysis to solve real word problems.

Unit I :

Overview of data science and analytics, Need of data science, Role and skills required for a data scientist, Technologies used in data analytics, Data analytics tools. Overview of artificial intelligence and machine learning. Division of machine learning tasks - supervised and unsupervised. Learning, predicting and classifying using machine learning.

Unit II :

Python: Introduction to Python language, Advantages of Python in comparison with other Languages, Characteristics of python, suitability of python in data manipulation and analysis, Data types, control structures, advanced data structures, I/O, defining classes, data collections, functions and modules, packages, exception handling and standard library in python. Computation capability of python. Powerfulness of libraries and tools of python in data manipulation, visualisation and data plotting like numpy, pandas, matplotlib, seaborn, scikit-learn.

Unit III :

Overview of machine learning algorithms, suitability of machine learning algorithms in data science problems and analytics, Application of machine learning in feature selection, Generalization of data using machine learning, Building predictive model by training with data and model evaluation, Need of dimensionality reduction of data.

Unit IV :

Regression analysis, techniques and its implementation using python, Regularisation techniques, Clustering, Cluster validation. Classification,

algorithms for classification, Accuracy of classification techniques, Confusion matrix.

Unit V :

Formation of a data set, development of training data, testing data, and validation data, cross validation. Analysis of a problem and its relevant dataset - data analysis, modeling and evaluation of this case including the processes of Regression, clustering, feature selection, dimensionality reduction, classification, cross validation etc -implementation in Python.

CSC3E17 - ADVANCED MACHINE LEARNING

Contact Hours per Week: 4 (3 Lecture + 1 Tutorial)

Number of Credits: 4

Course Outcomes:

CO1: Understand elementary mathematical concepts necessary for advanced machine learning algorithms.

CO2: Develop and model various supervised machine learning algorithms.

CO3: Implement recent and popular unsupervised machine learning approaches.

CO4: Understand setting up of machine learning projects and overview of reinforcement learning strategies.

CO5: Design and implement artificial neural network and deep learning architectures.

Unit I :Introduction to Elementary Linear Algebra, Probability and Machine Learning

Introduction to Linear Algebra: Matrices, Vector spaces, Orthogonality, Determinants, Overview of Eigenvalues and Eigenvectors. Fundamentals of Probability:- Axioms of probability, Conditional probability, Random variables, Probability distributions and Density functions, Joint distribution and density function, Conditional distribution, Bayes' rule, Expectation and Variance. Distributions: Bernoulli, Binomial, Multinomial, Uniform, Normal, Chi-Square, t and F. Introduction to Machine Learning:- Concept of learning the task, inductive learning and hypothesis space, different machine learning approaches, types of learning; supervised, unsupervised and reinforcement, machine learning applications

Unit II :Supervised Learning

Learning a class from example, learning multiple classes and multi-labels, model selection and generalization, linear regression and feature selection, Bayesian learning, Decision Tree learning, classification tree and regression tree, multivariate methods for learning, multivariate classification and regression

Unit III : Unsupervised Learning

clustering; mixture densities, k-means clustering, expectation maximization algorithm, mixture latent variable models, Latent Dirichlet Allocation, spectral and hierarchical clustering, Dimensionality reduction; principal component allocation, linear discriminant analysis, canonical correlation analysis.

Unit IV : Reinforcement Learning and Design and Analysis of ML Experiments

Single state case: K-Armed Bandit, Elements of reinforcement learning, model-based learning, temporal difference learning, generalization, partially observable states. Setting a machine learning platform: training, validation and testing, over-fitting and under-fitting, different types of error calculation. Cross-validation and resampling methods, Performance Analysis and accuracy measures: evaluation of machine learning algorithms, Binomial, Approximate Normal and t-tests

Unit V : Introduction to Artificial Neural Network and Deep Learning Concepts

Understanding brain, perceptron, Multi-Layer perceptron as universal approximator, the general architecture of an artificial neural network, feedforward and back-propagation, different linear and nonlinear activation functions for binary and multi-class and multi-label classification. Fundamentals of deep learning, Deep Feedforward Networks, Regularization for Deep Learning, Optimization for Training Deep Models, Introduction to Convolutional Networks, Sequence Modeling using Recurrent Nets, overview of LSTM and Bi-LSTM.

CSC3E18 - ADVANCED JAVA PROGRAMMING

Contact Hours per Week: 4 (3 Lecture + 1 Tutorial)

Number of Credits: 4

Course Outcomes:

CO1: Understand advanced concept of Java Programming, RMI and servlets

CO2: Understand the basics of RMI

CO3: Describe CORBA architecture

CO4: Implement Java Servlets

CO5: Illustrate the basic functionalities of EJB architecture.

Unit I :

Java Database connectivity- JDBC Architecture- Drivers- Database connections- Statements-Result sets-Transactions metadata- stored procedures-error handling-BLOBs and CLOBs. JNDI- Architecture-context-initial context class-Object in a context -listing the children of a context-binding objects -accessing directory services-X.500 directories-Dir context interface- Attributes and attribute interface-creating directory entities and searching.

Unit II :

RMI -Architecture- Defining remote Objects-Creating stubs and skeletons -Seializable classes-Accessing Remote Objects-factory classes-Dynamically loaded classes-RMI activation-Registering remote objects-marshalling and unmarshalling.

Unit III :

CORBA -Architecture-Services-IDL-ORB-Naming service-Inter-ORB Communication-creating CORBA objects-simple server class-helper class-holder class-stubs and skeletons-registering with naming services- finding remote object-adding object to naming context-Using naming context. Different models for CORBA server/clients and their implementations.

Unit IV :

Java Servlets- Servlet life cycle- Servlet chaining-HTTP servlets-forms and interaction-POST-HEAD and other request-server-side includes-cookies-Session tracking-databases and non-HTML Content-Request dispatching-shared attributes-resource abstraction.

Unit V :

Enterprise Java Beans:-EJB roles-EJB Client-Object ?container-Transaction Management-implementing a Basic EJB Object-Implementing session Beans-Implementing Entity Beans-Deploying an enterprise Java Beans Object.

CSC3C15 - PRACTICAL 3

Course Number: 6

Contact Hours per Week: 15 (10 Practical + 5 Tutorial)

Number of Credits: 3

Course Outcomes:

CO1: Develop programs related to the theory portions covered in CSC3C14 Web Technology.

Web Technology:

1. Create webpages using HTML, HTML5 including text, lists, Images and Videos, hyperlinks, tables and menus .
2. Design a data entry form using DHTML including java script validation.
3. Design a web page using XHTML including text, lists, data tables and anchor links.
4. Write an XML file describing some entity attributes. Write a document type definition(DTD) to validate the above XML file. Display the XML file contents in a coloured tabular format with suitable headings.
5. Programs to demonstrate the usage of regular expressions in perl.
6. Database programming with perl
7. Programming and web development using CGI-Perl.
8. Create a webpage using JSP and JDBC including operations of data storage and retrieval from database tables.
9. Develop dynamic database driven sites with PHP and MySQL.
10. Programming and web development using Python.

Fourth Semester

CSC4C16 - SOFTWARE ENGINEERING

Course Number: 1

Contact Hours per Week: 4 (3 Lecture + 1 Tutorial)

Number of Credits: 4

Course Outcomes:

CO1: Understand software process models and web engineering concepts.

CO2: Understand software requirements and structured analysis of systems.

CO3: Distinguish different types of modelling like DFD and UML.

CO4: Illustrate the process of software design and user interface design.

CO5: Understand the basic concepts of software quality and scheduling of software projects.

CO6: Illustrate various software testing processes.

CO7: Apply project management and report preparation skills.

Unit I :

Software Process Models: Software Process, Generic Process Model - Framework Activity, Task Set and Process Patterns; Process Lifecycle, Prescriptive Process Models, Component Based Development, Aspect-Oriented Software Development, Formal Methods. Agile Process Models - Extreme Programming (XP), Adaptive Software Development, Scrum, Dynamic System Development Model, Feature Driven Development, Crystal, Web Engineering.

Unit II :

Software Requirements: Functional and Non-Functional Requirements, Eliciting Requirements, Developing Use Cases, Requirement Analysis and Modelling, Software Requirement and Specification (SRS) Document.

Unit III :

Software Design: Abstraction, Architecture, Patterns, Separation of Concerns, Modularity. Information Hiding, Functional Independence, Cohesion and Coupling, Object-Oriented Design, Data Design, Architectural Design, User Interface Design, Component Level Design.

Unit IV :

Software Quality: McCall's Quality Factors, ISO 9126 Quality Factors, Overview of -Quality Control-Quality Assurance, Risk Management, Risk Mitigation, Monitoring and Management (RMMM). Estimation and Scheduling of Software Projects: Software Sizing, LOC and FP based Estimations. Constructive Cost Model (COCOMO).

Unit V :

Software Testing: Verification and Validation, Error, Fault, Bug and Failure, Unit and Integration Testing, White-box and Black-box Testing, Basis Path Testing, Control Structure Testing, Deriving Test Cases, Alpha and Beta Testing. Regression Testing, Performance Testing, Stress Testing, Re-engineering, Reverse Engineering.

References:

CSC4E19 - PATTERN RECOGNITION

Course Number: 2

Contact Hours per Week: 4 (3 Lecture + 1 Tutorial)

Number of Credits: 4

Course Outcomes:

CO1: Understand the fundamental concepts of pattern recognition and machine learning.

CO2 : Recognize the principles of Bayesian parameter estimation.

CO3: Apply pattern recognition methods for pre-processing, feature extraction, and feature Selection to multivariate data.

CO4: Understand basics of Bayes classifier and linear discriminant analysis.

CO5: Understand supervised and unsupervised classification methods to detect and characterize patterns in real-world data.

Unit I :

Introduction - introduction to statistical - syntactic and descriptive approaches - features and feature extraction - learning - Bayes Decision theory - introduction - continuous case - 2- category classification - minimum error rate classification - classifiers - discriminant functions - and decision surfaces - error probabilities and integrals - normal density - discriminant functions for normal density.

Unit II :

Parameter estimation and supervised learning - maximum likelihood estimation - the Bayes classifier - learning the mean of a normal density - general Bayesian learning - nonparametric technic - density estimation - parzen windows - k-nearest neighbour estimation - estimation of posterior probabilities - nearest-neighbour rule - k-nearest neighbour rule.

Unit III :

Linear discriminant functions - linear discriminant functions and decision surfaces - generalized linear discriminant functions - 2-category linearly separable case - non-separable behaviour -linear programming algorithms, support vector machines- multilayer neural networks - feed forward operation and classification, back propagation algorithm, error surface, back propagation as feature mapping.

Unit IV :

Syntactic methods - stochastic search- Boltzmann learning - Nonmetric methods- decision trees-CART - other tree methods, grammatical methods, grammatical inference.

Unit V :

Unsupervised learning and clustering - mixture densities and identifiability, maximum likelihood estimates, applications to normal mixtures, unsupervised Bayesian learning, data description and clustering.

References:

CSC4E20 - NATURAL LANGUAGE PROCESSING

Course Number: 2

Contact Hours per Week: 4 (3 Lecture + 1 Tutorial)

Number of Credits: 4

Course Outcomes:

CO1: Understand the fundamental concepts of Natural Language Processing.

CO2: Design algorithms for solving NLP based problems.

CO3: Develop useful systems for language processing and related tasks involving text processing.

Unit I :

Introduction - Models -and Algorithms - The Turing Test -Regular Expressions Basic Regular Expression Patterns -Finite State Automata - Regular Languages and FSAs - Morphology - Inflectional Morphology - Derivational Morphology -Finite-State Morphological Parsing - Combining an FST Lexicon and Rules -Porter Stemmer.

Unit II :

N-grams Models of Syntax - Counting Words - Unsmoothed N-grams - Smoothing- Backoff -Deleted Interpolation - Entropy - English Word Classes - Tagsets for English - Part of Speech Tagging -Rule-Based Part of Speech Tagging - Stochastic Part of Speech Tagging - Transformation-Based Tagging.

Unit III :

Context Free Grammars for English Syntax- Context-Free Rules and Trees - Sentence- Level Constructions - Agreement - Sub Categorization - Parsing - Top-down - Earley Parsing - Feature Structures - Probabilistic Context-Free Grammars.

Unit IV :

Representing Meaning - Meaning Structure of Language - First Order Predicate Calculus-Representing Linguistically Relevant Concepts -Syntax-Driven Semantic Analysis - Semantic Attachments - Syntax-Driven Analyzer - Robust Analysis - Lexemes and Their Senses - Internal Structure - Word Sense Disambiguation -Information Retrieval.

Unit V :

Discourse -Reference Resolution - Text Coherence -Discourse Structure
- Dialog and Conversational Agents - Dialog Acts - Interpretation - Co-
herence - Conversational Agents - Language Generation - Architecture -
Surface Realizations - Discourse Planning - Machine Translation - Trans-
fer Metaphor - Interlingua - Statistical Approaches.

3. James Allen. Natural Language Understanding, Addison Wesley, 1994.

CSC4E21 - BIOINFORMATICS

Course Number: 2

Contact Hours per Week: 4 (3 Lecture + 1 Tutorial)

Number of Credits: 4

Course Outcomes:

CO1: Understand the basic concepts of Bioinformatics and its significance in Biological data analysis.

CO2: Understand the popular genomic and proteomic databases and to impart knowledge in processing and analysing genomic data.

CO3: Identify steps in sequence alignment.

CO4: Conceptualise the advanced topics in Bioinformatics.

Unit I :

Cells-Prokaryotes and Eukaryotes-DNA double helix- central dogma - RNA, Amino acids, Proteins -string representations- different levels of protein structures-DNA cloning- A brief introduction to different mappings techniques of genomes- genome sequencing methods-DNA micro arrays - Human Genome Project-A glossary of biological terms.

Unit II :

Scope of bioinformatics-Genomics and Proteomics- Problems in bioinformatics - sequence alignment, phylogeny, gene finding, microarray analysis, Homology and evolutionary relationships; Homology analysis and function of an entire gene or of segments within it, secondary structure prediction, protein structure prediction, comparative genomics and drug design.

Unit III :

Data management, Data life cycle, An introduction to the major resources at NCBI, EBI and ExPASy - Nucleic acid sequence databases: GenBank, EMBL, DDBJ - Protein sequence databases: SWISS-PROT, TrEMBL, PIR-PSD - Genome Databases at NCBI, EBI, TIGR, SANGER - How to access these databases and to make use of the tools available. Various file formats for bio-molecular sequences like genbank and fasta, the concept of profiles- The derived databases- Prosite, Pfam, PRINTS, CATH, SCOP.

Unit IV :

Basic concepts of sequence similarity, identity and homology, definitions of homologues, orthologues, paralogues. Scoring matrices: basic concept of a scoring matrix, PAM and BLOSUM matrices, differences between distance and similarity matrix, Pairwise sequence alignments: basic concepts of sequence alignment, Needleman and Wunchsh, Smith and Waterman algorithms for pairwise alignments, BLAST and FASTA and their versions, Multiple sequence alignments (MSA): the need for MSA, basic concepts of various approaches for MSA (e.g. progressive, hierarchical etc.), Algorithm of CLUSTALW.

Unit V :

Phylogeny: Basic concepts of phylogeny; molecular evolution; Definition and description of phylogenetic trees, Phylogenetic analysis algorithms - Maximum Parsimony, UPGMA and Neighbour-Joining, Gene Finding: The six reading frames-Computational gene finding in prokaryotes and eukaryotes Basic signals - start and stop codons, promoters etc- important coding measures- Regular expressions- Introduction to Hidden Markov models- Introduction to genomic signal processing Molecular visualization: Visualization of protein structures using Rasmol or Rastop

CSC4E22 - MOBILE COMMUNICATION

Course Number: 2

Contact Hours per Week: 4 (3 Lecture + 1 Tutorial)

Number of Credits: 4

Course Outcomes:

CO1: Understand the fundamental concepts of wireless and mobile networks.

CO2: Illustrate the wireless application protocols for mobile content development.

CO3: Understand TCP/IP extensions for wireless mobile networking.

CO4: Understand WAP Design and principles of operations.

CO5: Analyze various wireless mobile programming methodologies.

CO1: Understand the fundamental concepts of wireless and mobile networks. CO2: Illustrate the wireless application protocols for mobile content development. CO3: Analyze various wireless mobile programming methodologies. CO4: Understand security aspects of wireless networks. CO5: Understand TCP/IP extensions for wireless mobile networking.

Unit I :

Introduction, wireless transmission - frequencies for radio transmission - signal propagation - multiplexing - modulation - spread spectrum - cellular systems - medium access control - specialized MAC - SDMA - FDMA - TDMA - classical and slotted aloha - CSMA - collision avoidance - polling - CDMA - comparison of S/T/F/CDMA.

Unit II :

Telecommunication systems - GSM-mobile services - system architecture - radio interface - protocols - localization and calling - handover - security - new data services - satellite systems- routing- localization - handover-broadcast systems - digital audio and video broadcasting.

Unit III :

Wireless LAN-Infra red Vs radio transmission -infra structure and adhoc networks-IEEE 802.11, hyperlan- Bluetooth -IEEE 802.15

Unit IV :

Mobile network layer - mobile IP - IP packet delivery - registration - tunneling and encapsulation - optimizations - reverse tunneling - dynamic host configuration protocol-Mobile ad-hoc networks, Transport Layer-TCP-Indirect TCP-Snooping TCP-Mobile TCP- retransmission-recovery-transaction oriented TACP

Unit V :

WAP-Design and principles of operations, WAP architecture, Overview-WAP model, components-WAE, overview-WWW model-WAE model-WTA architecture, Wireless session protocol specifications-Wireless transaction protocol specification-security specification- Wireless datagram protocol-wireless control message protocol specification.

CSC4E23 - SEMANTIC WEB TECHNOLOGY

Course Number: 2

Contact Hours per Week: 4 (3 Lecture + 1 Tutorial)

Number of Credits: 4

Course Outcomes:

CO1: Understand the concept structure of the Semantic Web technology and how this technology revolutionizes the World Wide Web and its uses.

CO2: Understand the concepts of metadata, semantics of knowledge and resource, ontology, and their descriptions.

CO3: Model ontology engineering approaches in semantic web applications.

Unit I :

Components - types - ontological commitments - ontological categories - philosophical background - knowledge representation ontologies - top level ontologies - linguistic ontologies - domain ontologies - semantic web - need - foundation - layers - architecture.

Unit II :

Languages for semantic web and ontologies - web documents in XML - RDF - schema - web resource description using RDF - RDF properties - topic maps and RDF - overview - syntax structure - semantics - pragmatics - traditional ontology languages - LOOM - OKBC - OCML - Flogic Ontology Markup Languages - SHOE - OIL - AML - OIL - OWL.

Unit III :

Ontology learning for semantic web - taxonomy for ontology learning - layered approach - phases of ontology learning - importing and processing ontologies and documents - ontology learning algorithms - evaluation.

Unit IV :

Ontology management and tools - overview - need for management - development process - target ontology - ontology mapping - skills management system - ontological class - constraints - issues. Evolution - development of tools and tool suites - ontology merge tools - ontology based annotation tools.

Unit V :

Applications - web services - semantic web services - case study for specific domain - security issues - current trends.

CSC4E24 - VIRTUALIZATION AND CLOUD COMPUTING

Course Number: 2

Contact Hours per Week: 4 (3 Lecture + 1 Tutorial)

Number of Credits: 4

Course Outcomes:

CO1: Understand the basics of cloud computing and virtualization.

CO2: Identify cloud infrastructure and the key application features delivered on virtual infrastructures.

CO3: Describe parallel and distributed programming models and programming paradigms.

CO4: Understand mapping applications and Hadoop configuration.

CO5: Analyze security challenges in the cloud.

Unit I :

Introduction - evolution of cloud computing - system models for distributed and cloud computing - NIST cloud computing reference architecture - Infrastructure as a Service (IaaS) - resource virtualization - Platform as a Service (PaaS) - cloud platform and management - Software as a Service (SaaS) - available service providers.

Unit II :

Virtualization - basics of virtualization - types of virtualization - implementation levels of virtualization - virtualization structures - tools and mechanisms - virtualization of CPU, memory, I/O devices - desktop virtualization - server virtualization - Linux KVM, Xen, Qemu, LXC, OpenVZ.

Unit III :

Cloud infrastructure - FOSS cloud software environments - Eucalyptus, Open Nebula, OpenStack - OpenStack architecture - compute, object storage, image service, identity, dashboard, networking, block storage, metering, basic cloud orchestration and service definition.

Unit IV :

Programming model - parallel and distributed programming paradigms - Mapreduce, twister and iterative Mapreduce - mapping applications -

programming support - Apache Hadoop - HDFS, Hadoop I/O, Hadoop configuration, MapReduce on Hadoop.

Unit V :

Security in the cloud - security overview - cloud security challenges - software-as-a-service security - security governance - risk management - security monitoring - security architecture design - data security - application security - virtual machine security - Qubes - desktop security through Virtualization.

CSC4E25 - STORAGE AREA NETWORK

Course Number: 2

Contact Hours per Week: 4 (3 Lecture + 1 Tutorial)

Number of Credits: 4

Course Outcomes:

CO1: Understanding basic networking concepts and topology.

CO2: Understand the network architecture of storage network.

CO3: Model various aspects of Storage network management.

CO4: Understand the concepts of designing and building of SAN.

Unit I :

Basic networking concepts and topologies - OSI reference model, common network devices, network topologies, MAC standards - need for storage networks - storage devices - techniques evolution - benefits of SANs - SAN components and building blocks - fibre channel basics - fibre channel topologies, fibre channel layers, classes of service SAN topologies.

Unit II :

SAN fundamentals - SAN operating systems software and hardware types of SAN technology - technology and configuration, high scalability and flexibility standards - storage management challenges - networked storage implementation challenges - storage subsystems for video services.

Unit III :

Storage networking architecture storage in storage networking - challenges, cost and performance network in storage networking - fibre channel, emerging SAN interconnect technologies - basic software, advanced software, backup software implementation strategies.

Unit IV :

Storage network management in-band management out-of-band management -SNMPHTTP - TELNET storage network management issues - storage resource management - storage management, storage, systems and enterprise management integration.

Unit V :

Designing and building a SAN - design considerations - business requirements - physical layout, placement, storage, pooling, data availability, connectivity, scalability, migration, manageability, fault tolerance and resilience - prevention of congestion - routability - backup and restoration - SAN security and iSCSI technology - basic security guidelines - implementing SAN security - backup and restoration in iSCSI technology - future of SANS.

CSC4E26 - SOFTWARE DEVELOPMENT FOR PORTABLE DEVICES

Course Number: 2

Contact Hours per Week: 4 (3 Lecture + 1 Tutorial)

Number of Credits: 4

Course Outcomes:

CO1: Understand mobile web application development

CO2: Apply HTML 5 tags and attributes .

CO3: Use jQuery events and event handling methods.

CO4: Implement mobile application using audio and video, location based, and network connectivity services.

Unit I :

Introduction to Mobile Web (HTML 5) - Semantic Elements - Structural Elements - Basic formatting tags - heading, paragraph, underline break, bold, italic, underline, superscript, subscript, font and image. Different attributes like align, color, bgcolor, font face, border, size. Navigation Links using anchor tag - internal, external, mail and image links. Lists - ordered, unordered and definition, table tag, HTML5 form controls - form, input types - color, date, datetime, datetime-local, email, month, number, range, search, tel, time, url, week, text, password, textarea, button, checkbox, radio button, select box, hidden controls, calendar, date, time, email, url, search. Datalist, keygen, output - Introduction to CSS3.

Unit II :

jQuery - introduction - Adding jQuery to web pages - downloading - accessing from CDNs - jQuery syntax - jQuery selectors - event methods - ready(), click(), dblclick(), mouseenter(), mouseleave(), mousedown(), mouseup(), hover(), focus(), blur() - effects - hide, show, fading, sliding, animation - callback functions - chaining - methods for changing and manipulating HTML elements and attributes - adding new elements/content - append(), prepend(), after(), before() - removing elements - remove(), empty() - manipulating CSS3 - dimensions of elements and browser window - traversing - ancestors, descendants, siblings.

Unit III :

Introduction to Android and smart phones, Android architecture and virtual machine, mobile technology terminologies, setting up the environment, setting up emulators, Android fundamentals - activities and applications activity life cycles, activity stacks, activity states. Introduction to manifest, resources and R.java, assets, values - strings.xml - form widgets, views, layouts and drawable resources - XML layouts, linear layouts, relative layouts, table layouts, Android widgets, UI XML specifications events, bundles and intents - explicit intents implicit intents event broadcasting with intents event reception with broadcast receivers, adapters and data binding.

Unit IV :

Files, content providers and databases - saving and loading files, SQLite databases - Android database design - exposing access to a data source through a content provider content provider registration native content providers, Android Debug Bridge (adb) tool, Linkify.

Unit V :

Adapters and widgets, notifications, custom components threads running on UI thread, Worker thread handlers and runnable asyntask (in detail), playing audio and video, recording audio and video, using the camera to take and process pictures. Networking and location based services - live folders, using sdcards - reading and writing, XML parsing - JSON parsing - including external libraries in applications, Map-based activities, Maps via intent and Map activity GPS, location based services configuration, geocoding, accessing phone services (Call, SMS, MMS), network connectivity services, using Wifi and Bluetooth action bar tabs and custom views on action bars.

CSC4E27- FUNDAMENTALS OF BIG DATA

Course Number: 2

Contact Hours per Week: 4 (3 Lecture + 1 Tutorial)

Number of Credits: 4

Course Outcomes:

CO1: Build knowledge about the importance of Big Data.

CO2: Familiarize the concept of NoSQL databases

CO3: Illustrate awareness about Hadoop Distributed File System

CO4: Understanding the concept of MapReduce

Unit I :

Introduction to Big Data - definition and importance of Big Data - four dimensions of Big Data - volume, velocity, variety, veracity - importance of big data - structured data, unstructured data - the role of a CMS in big data management - integrating data types into a big data environment - distributed computing and Big Data. Big Data stack - layer 0,1 and 2 - Big Data management - operational databases - relational databases - non relational databases - NoSQL - key-value pair databases - document databases - columnar databases - graph databases - spatial databases.

Unit II :

Big Data analysis - basic analytics - operationalized analytics - modifying business intelligence products to handle Big Data - Big Data analytics examples - Analytics solutions - text analytics - exploring unstructured data - understanding text analytics - analysis and extraction techniques - the extracted information - text analytics tools for Big Data - custom applications for Big Data analysis - R Environment - Google Prediction API - Characteristics of a Big Data Analysis Framework.

Unit III :

NoSQL databases - types - Advantages over Relational Databases - MongoDB - introduction - MongoDB philosophy - the data model - designing the database - collections - documents - data types - the -id Field - indexes - viewing available databases and collections - opening a database - inserting data - querying for data - retrieving documents - aggregation commands - grouping results - conditional operators - specifying an array of matches - applying criteria for search - \$slice - \$size - \$exists - \$type

- \$elemMatch - \$not (meta-operator) - update() - save() - \$inc - \$set
- \$unset - \$push - \$pushAll - \$addToSet - removing elements from an array - atomic operations - modifying and returning a document atomically - renaming a collection - removing data - referencing a database - implementing index-related functions - min() and max().

Unit IV :

Hadoop - history - components - HDFS - MapReduce Basics - origins of MapReduce - map function - reduce function - putting them together - Hadoop common components - application development in Hadoop - Pig and Pig Latin - Load - Transform - Dump and Store - Hive - Jaql - getting our data into Hadoop - basic copy data - Flume - Zookeeper - HBase - Oozie - Lucene - Avro.

Unit V :

Understanding MapReduce - key/value pairs - the Hadoop Java API for MapReduce - the Mapper class - the Reducer class - the Driver class - writing simple MapReduce programs - Hadoop-provided mapper and reducer implementations - Hadoop-specific data types - the Writable and WritableComparable interfaces - wrapper classes - Input/output - InputFormat and RecordReader - OutputFormat and RecordWriter. Implementing WordCount using streaming - analyzing a large dataset - summarizing the UFO data - summarizing the shape data - a relational view on data with Hive - creating a table for the UFO data - inserting the UFO data - redefining the table with the correct column separator - creating a table from an existing file - SQL views.

CS3C17: Project Work & Dissertation

Course Number: 3

Number of Credits: 8

Course Outcomes:

- CO1:** Understand programming language concepts and software engineering principles to develop a medium sized software projects for industry or propose any new model for the selected field of research.
- CO2:** Understand the project requirements, reflect on their learning and take appropriate actions to implement it.
- CO3:** Communicate effectively and to present ideas clearly and coherently to specific audiences in both the written and oral forms.
- CO4:** Understand the importance of iteration, evaluation and prototyping in design of a software system.
- CO5:** Estimate, plan, calculate, and adjust project variables.
- CO6:** Innovate, experiment and analyze research findings and practice the process of scientific publishing.

Course Outline

Major project work is to be done individually by each student, under the guidance of a faculty member of the Department. Project Supervisor has to constantly monitor the works done by the student, imparting him/her the necessary inputs for the successful completion of the project work. Students can either take up real-life application-oriented project work or research and development projects. The student can formulate a project problem with the help of her/his guide and submit the project proposal of the same. Approval of the project proposal is mandatory. If approved, the student can commence working on it, and complete it.

Guidelines for Submission of Report

The distinguishing mark of a dissertation is an original contribution to knowledge. The dissertation is a formal document whose sole purpose is to prove that you have made an original contribution to knowledge. Failure to prove that you have made such a contribution generally leads to failure. It is a test of the student's ability to undertake and complete a sustained piece of independent research and analysis / application development, and to write up the work in a coherent form according to the rules and conventions of the academic

community. The role of the supervisor too is very crucial in this context. A satisfactory dissertation should not only be adequate in its methodology, in its analysis and in its argument, and adequately demonstrate its author's familiarity with the relevant literature; it should also be written in correct, coherent language, in an appropriate style, correctly following the conventions of citation. It should, moreover, have a logical and visible structure and development that should at all times assist the reader understand the arguments being presented. The layout and physical appearance of the dissertation should also conform to university standards. The dissertation is to be prepared in TEX format (either Latex or a suitable Windows TEX variant). Students are also encouraged to present their work in Seminar/ conference/ workshop/journal with the assistance and guidance of the Project supervisor. This should pave as a good start for the student in the art of publishing/ presenting his/her work to the outside world. Due weightage is accommodated for publications out of the project work in the final evaluation.

General Pattern of Question Paper

Core and Elective courses in M.Sc. Computer Science Programme

Under CCSS (with effect from 2020 Admission onwards)

Code:

Reg. No:

Name:

1st/2nd/3rd/4th Semester M.Sc. Computer Science Degree Examination – 2020

(CCSS – M.Sc. Programme)

Course Code : (eg: CSC1C02) Course : (Eg: Advanced Data Structures and Algorithms)

Time: 3 Hours

Total Marks: 80

Answer five full questions; Each Question carries 16 marks.

Question Numbers:1 to 8

Total Marks = 5 x 16 = 80 Marks

NOTE: Minimum one question from each of the five modules. Remaining three questions can be from any module. There should not be more than two questions from the same module.
